

# QTL mapping with -omics scale data

Cody Markelz

Plant Developmental Biology

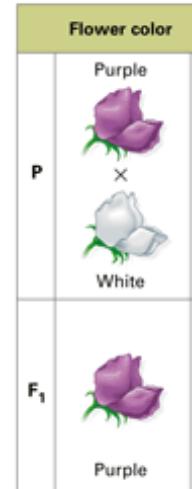

2015\_02\_18

# Lecture Outline

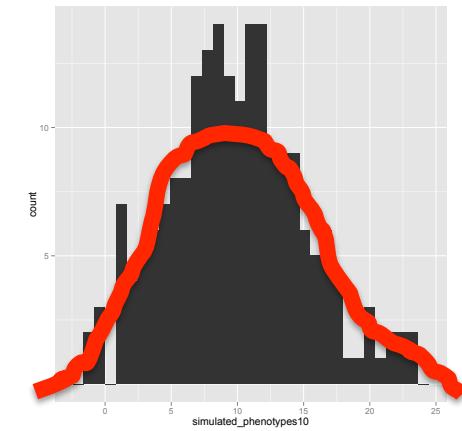

- What is a QTL?
- Successful QTL mapping examples
- Single Marker Regression
- Simple Interval Mapping
- Multi-QTL models
- Genome Wide Data- How do we scale?
- Expression QTL (eQTL)
- Integrating eQTL with other QTL for candidate gene identification

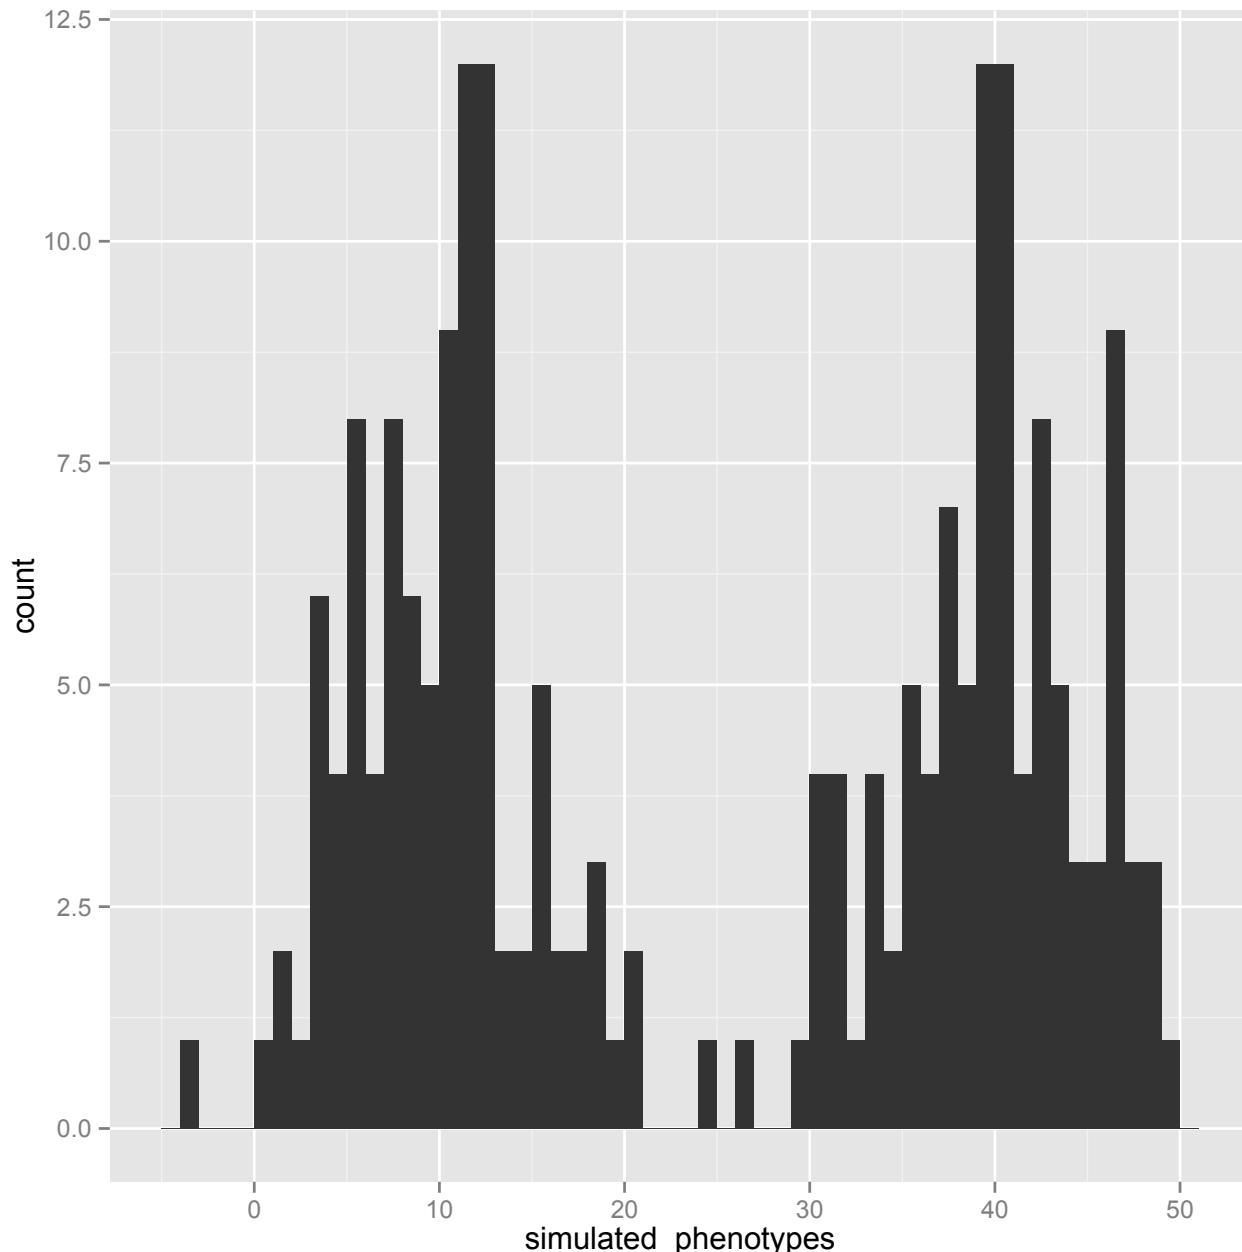

# What is a QTL?

- Quantitative Trait Loci
- A genetic locus that contributes to quantitative variation in a trait
- Simple discrete traits vs. continuous traits
  - number of genes involved
  - environmental effects
  - genetic background

vs.

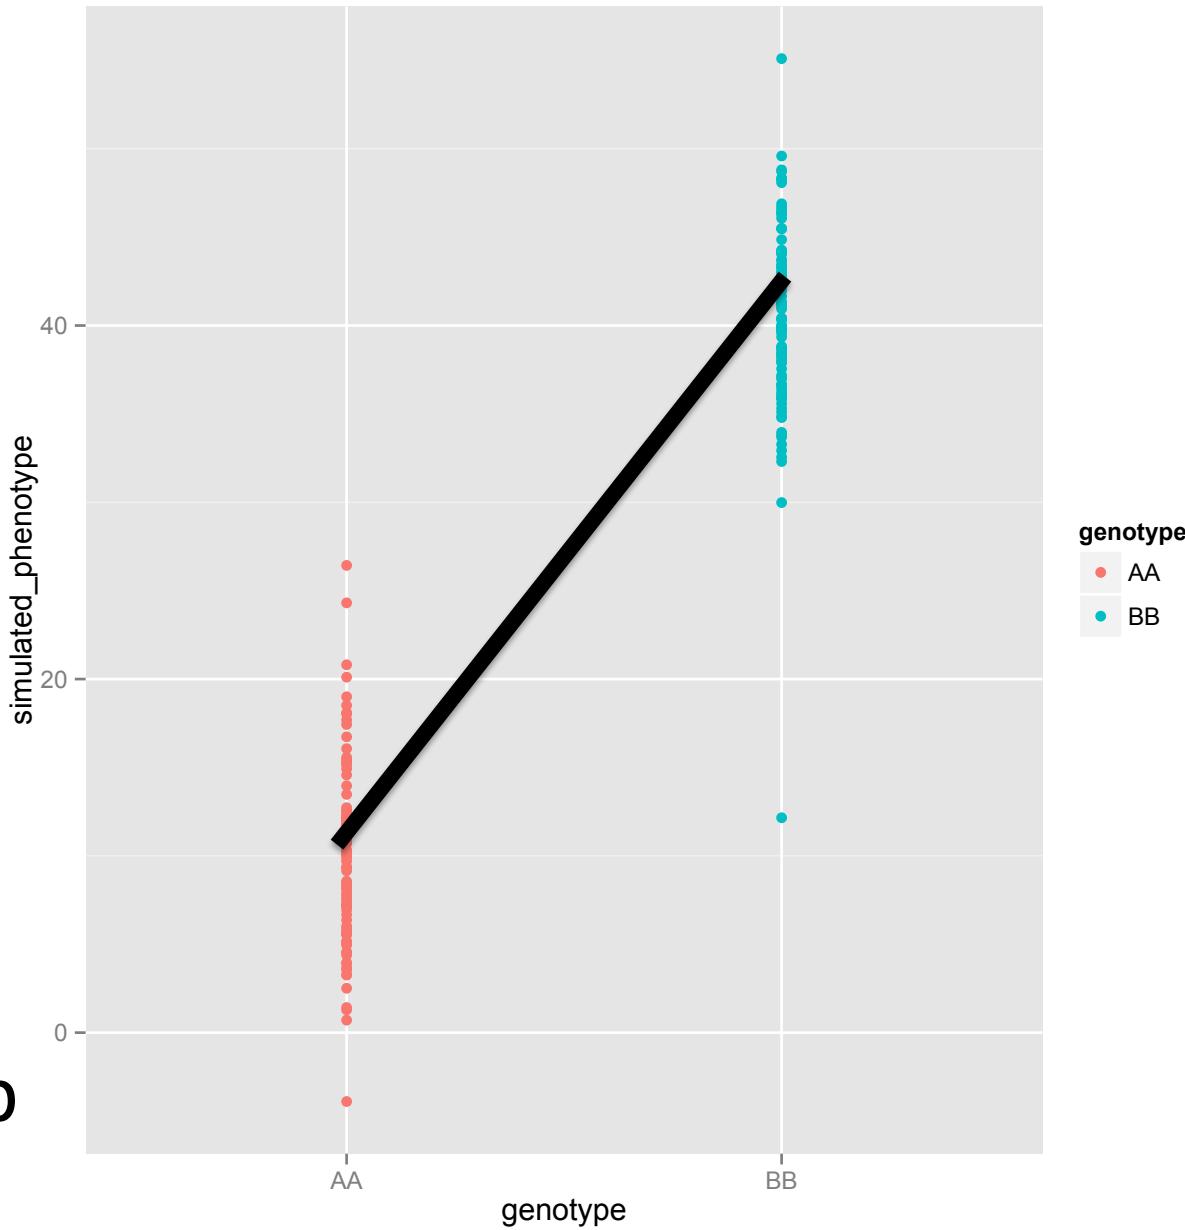

**Mean = 10**

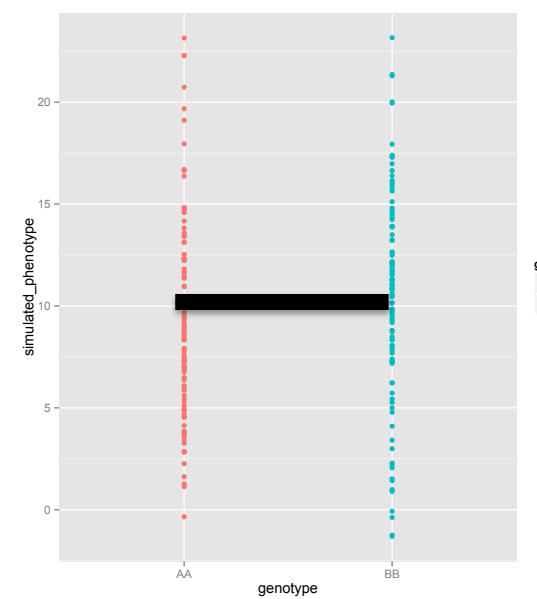

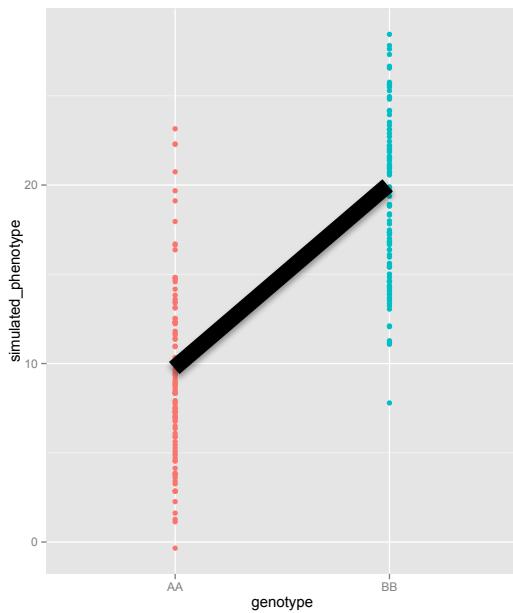

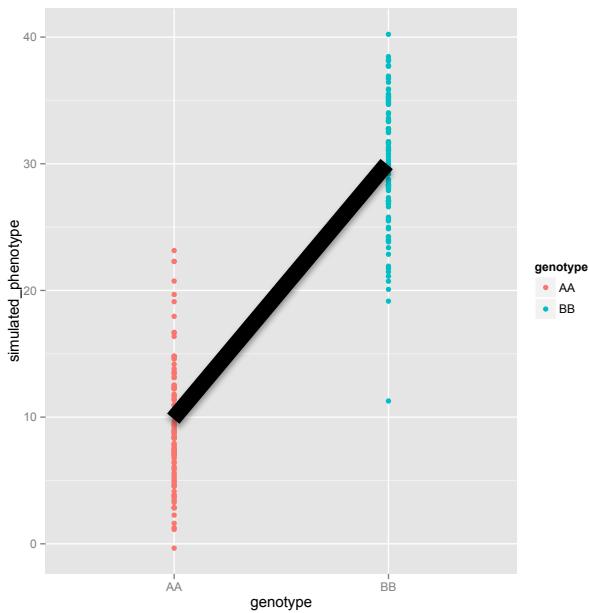

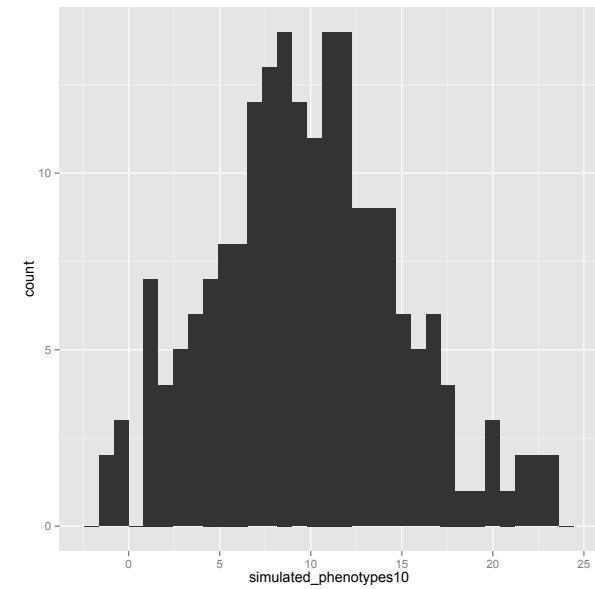

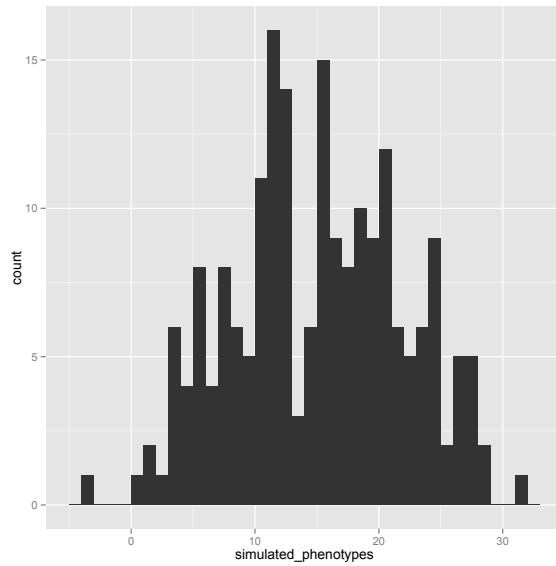

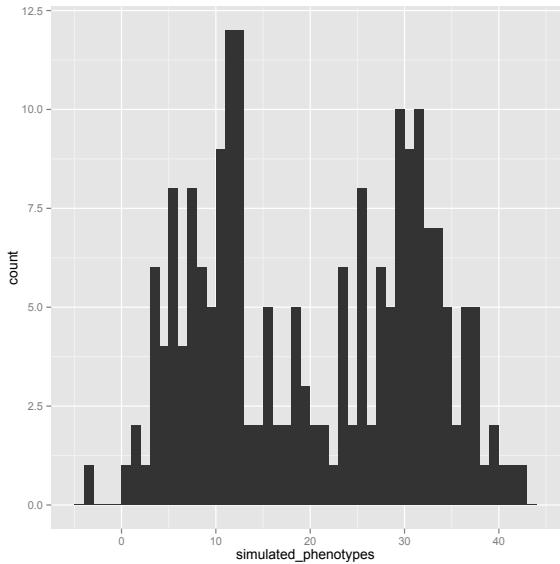

**Mean = 40**

$$y = mx + b$$

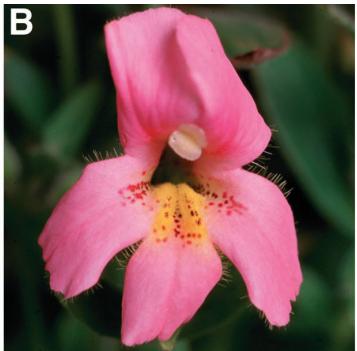

$$\text{phenotype} = m * \text{gtBB} + \text{mean} + \text{error}$$

Given genotype, is slope different from 0?

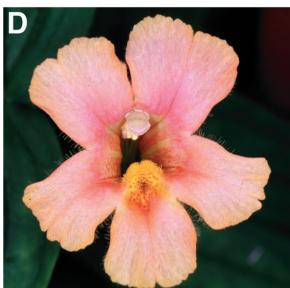

**M. lewisii**

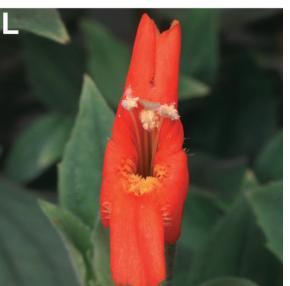

**M. cardinalis**

**F1**

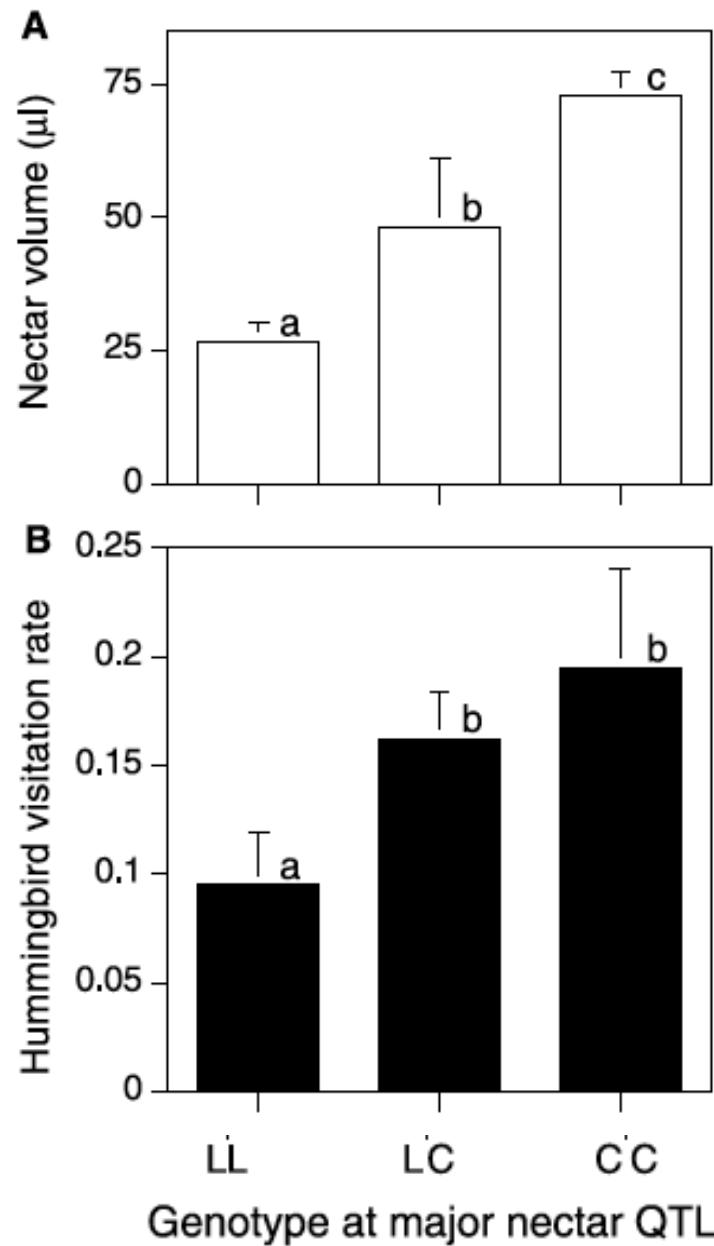

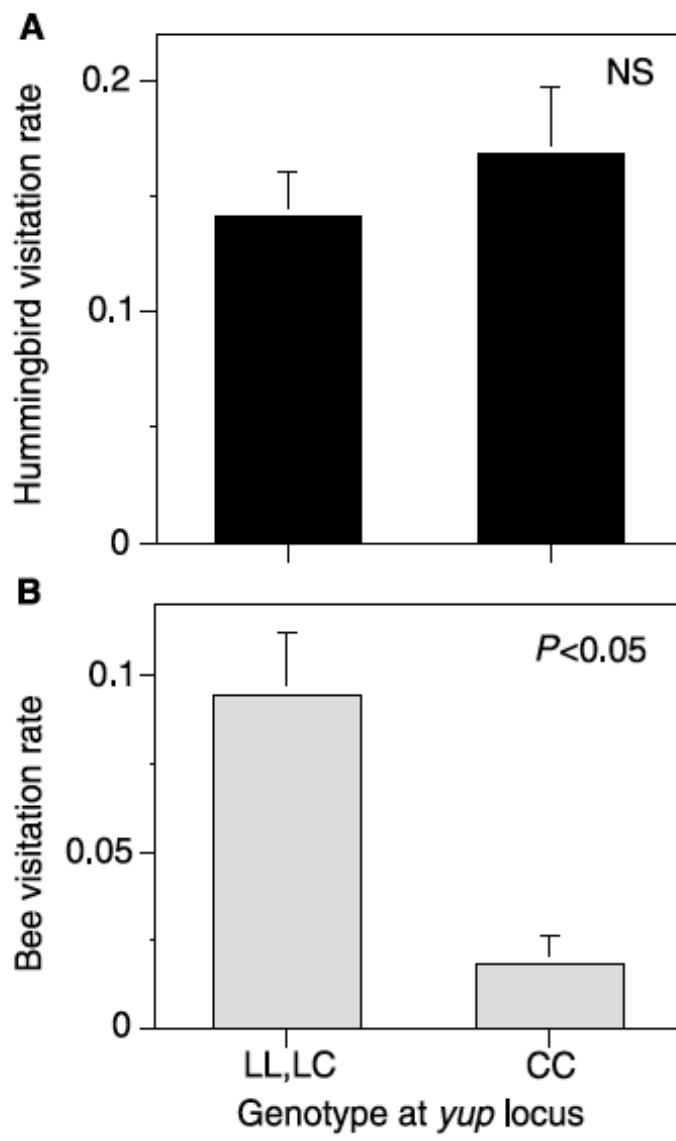

**F2**

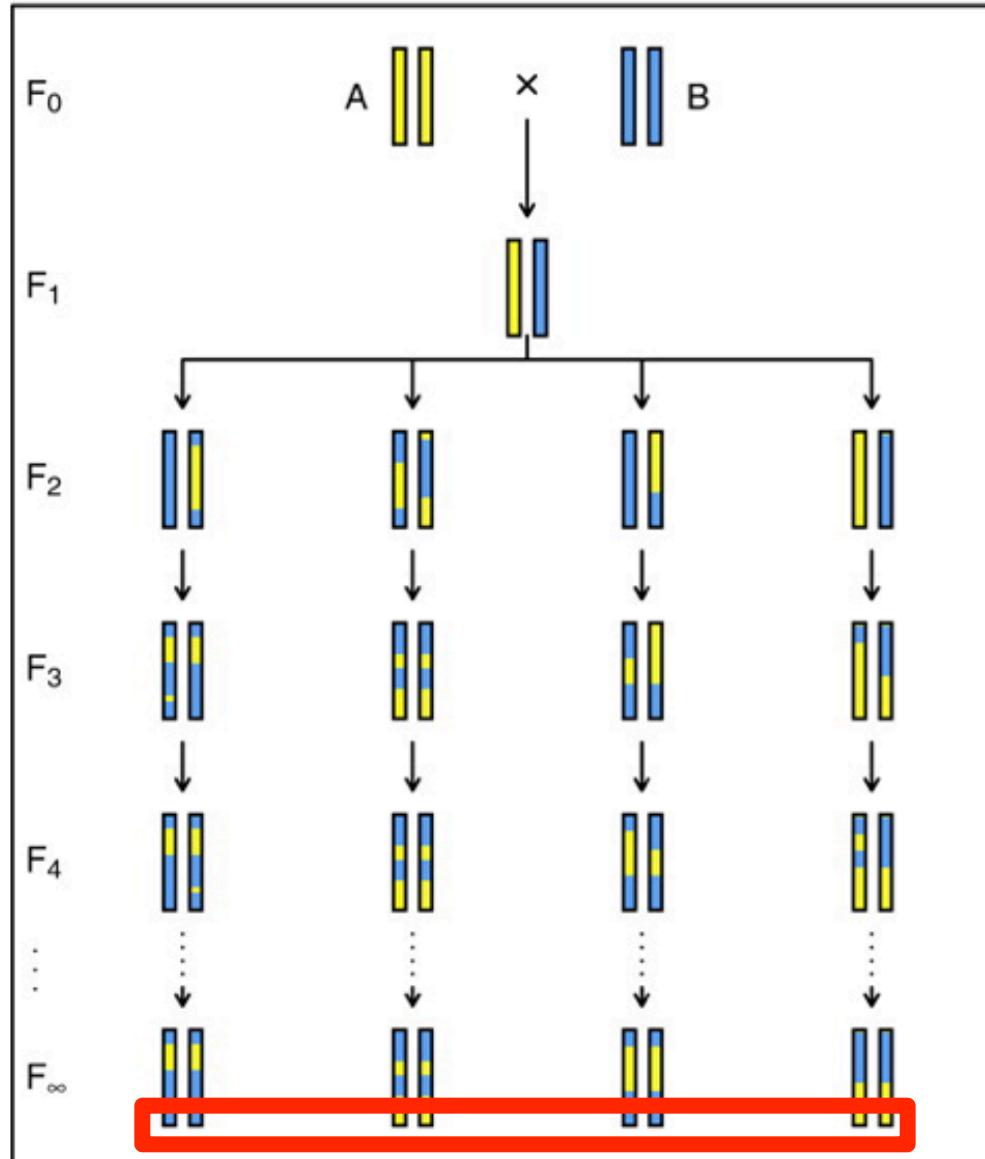

**Schemske and  
Bradshaw  
PNAS 1999**

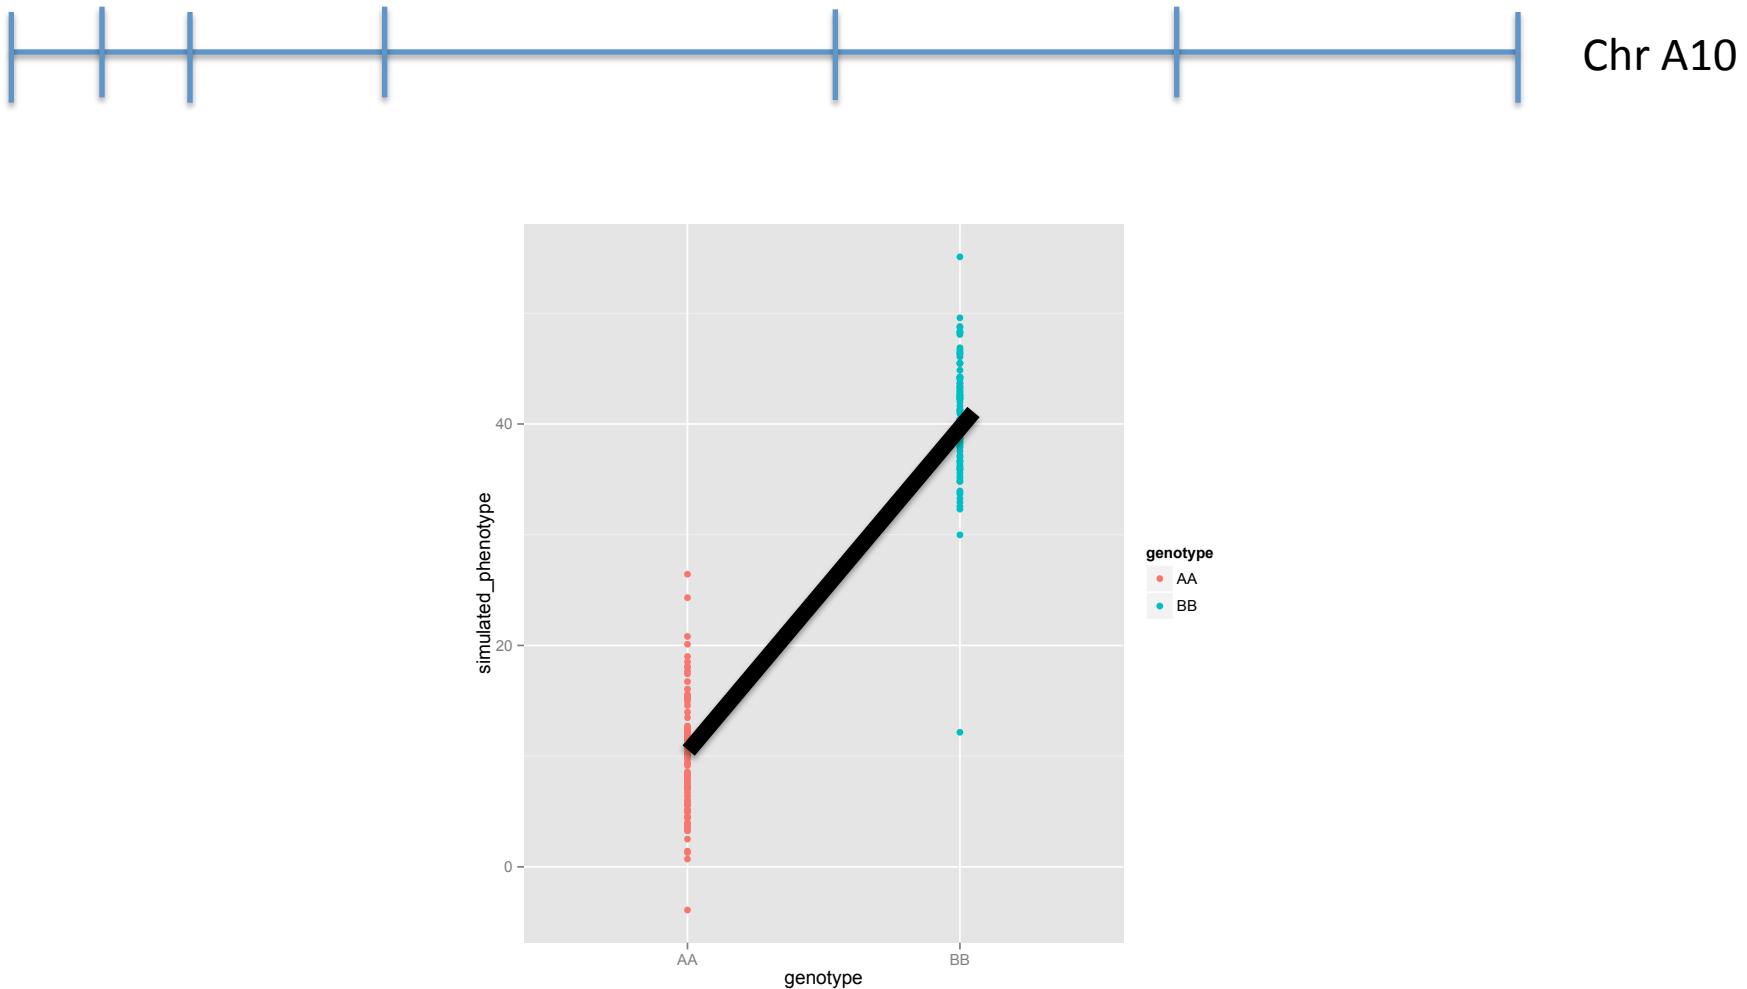

# Flower phenotype QTL alter pollinator visits!

# Recombinant Inbred Lines (RILs)

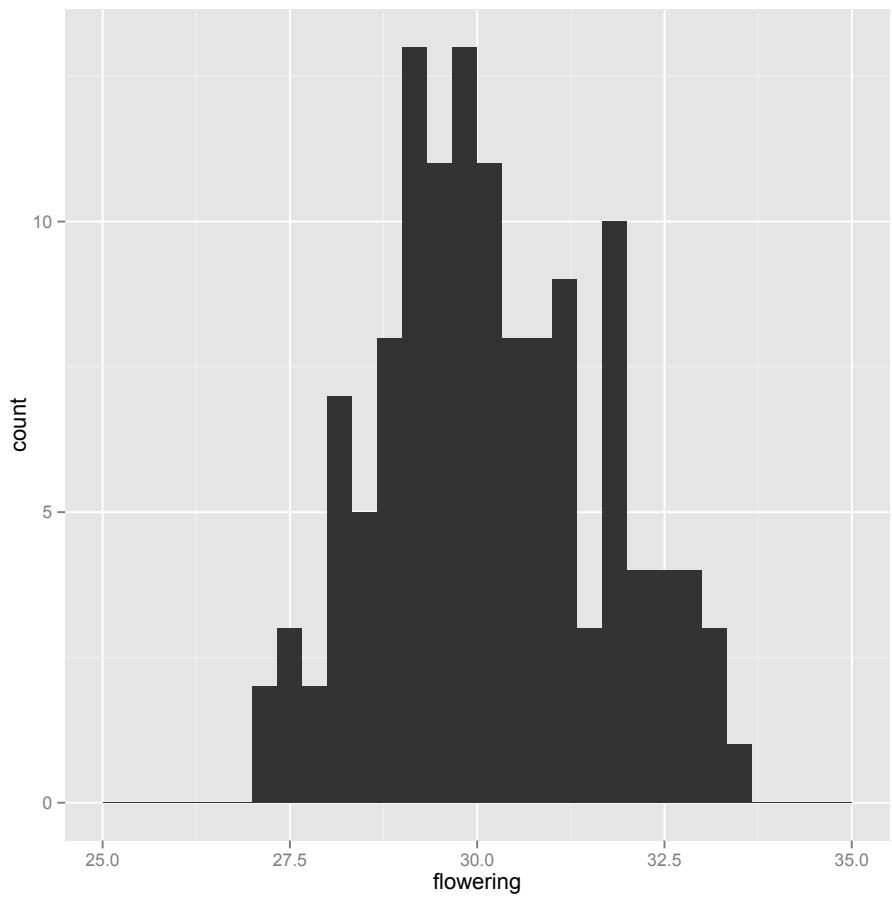

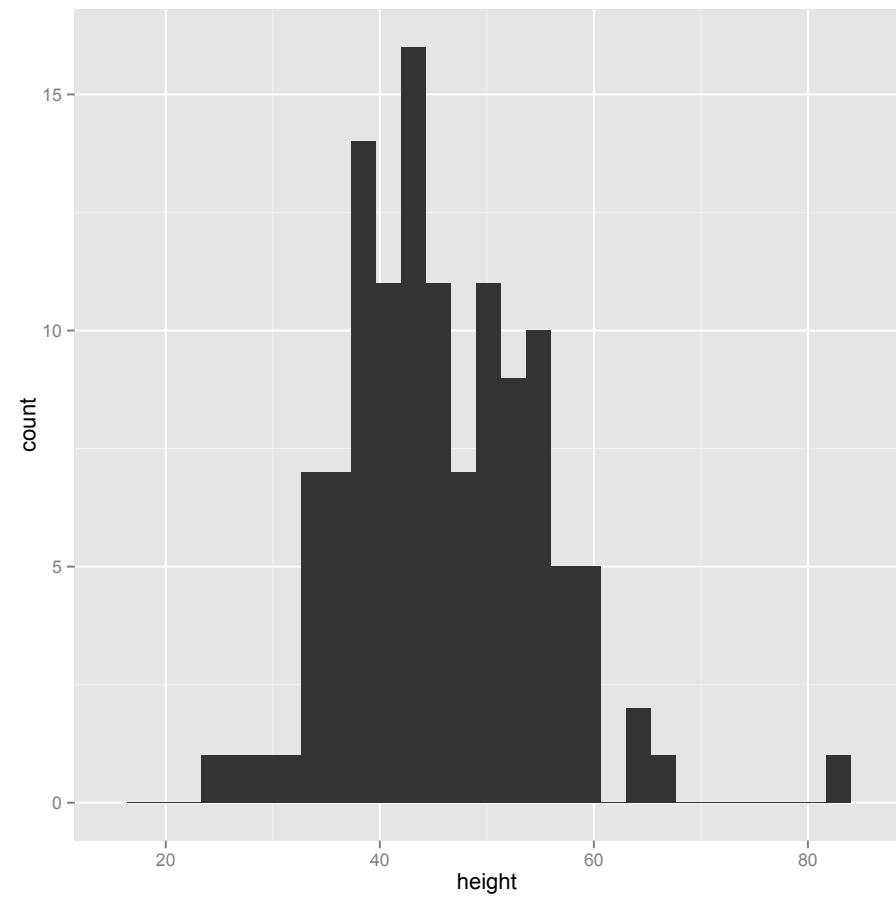

# Marker Regression

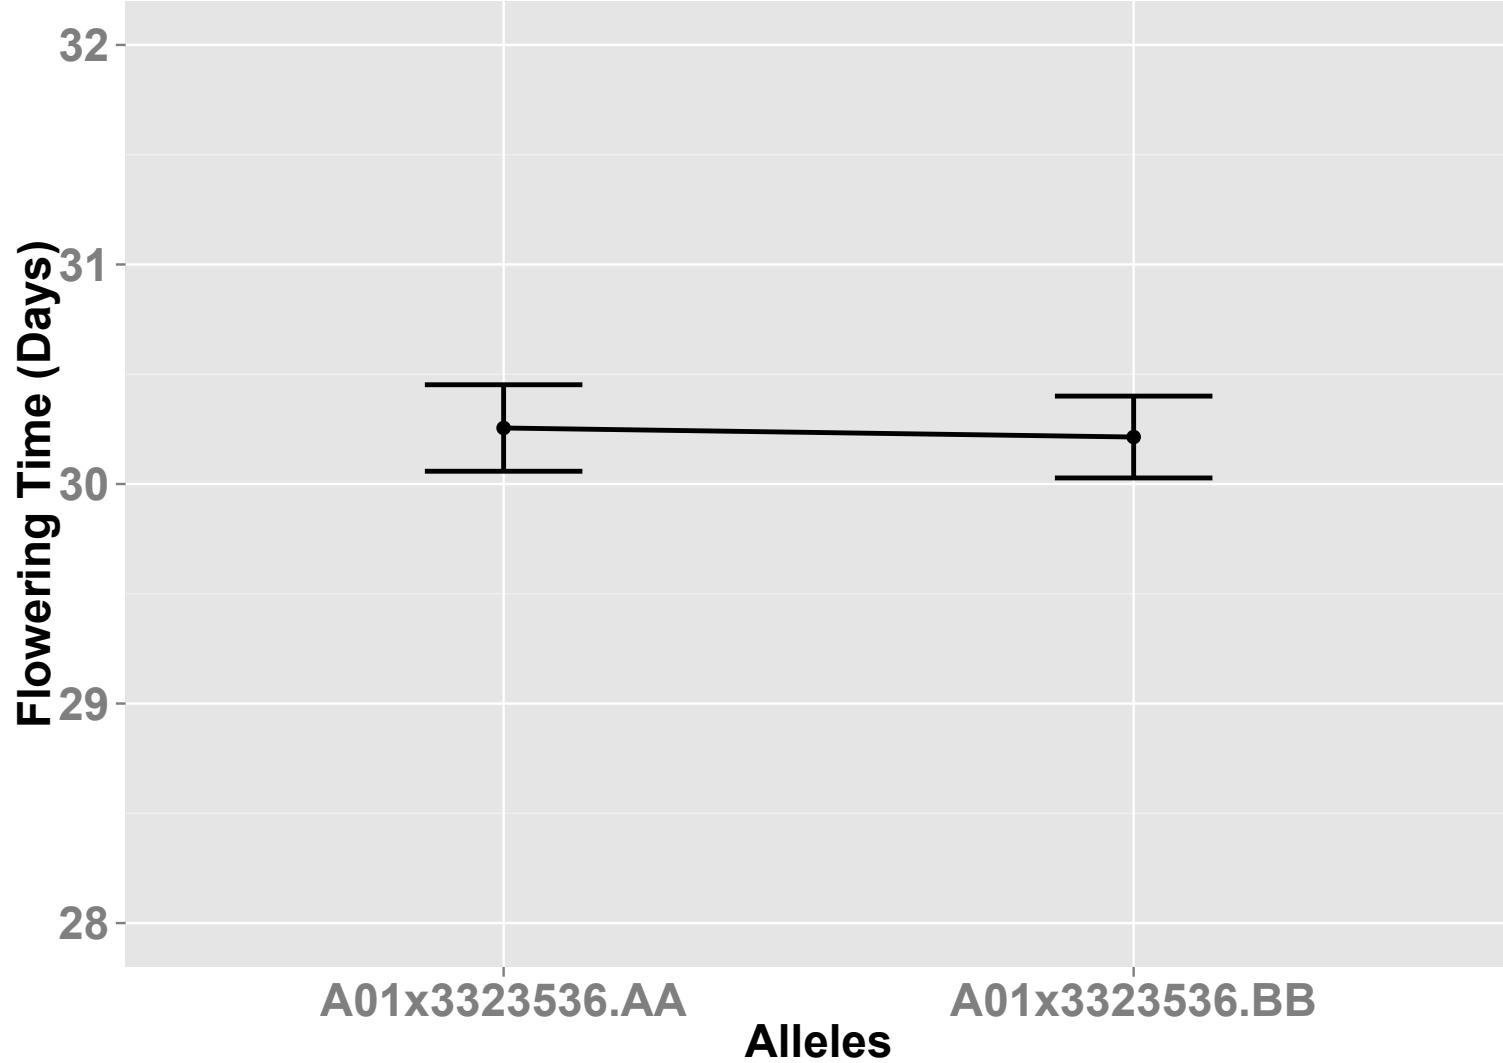

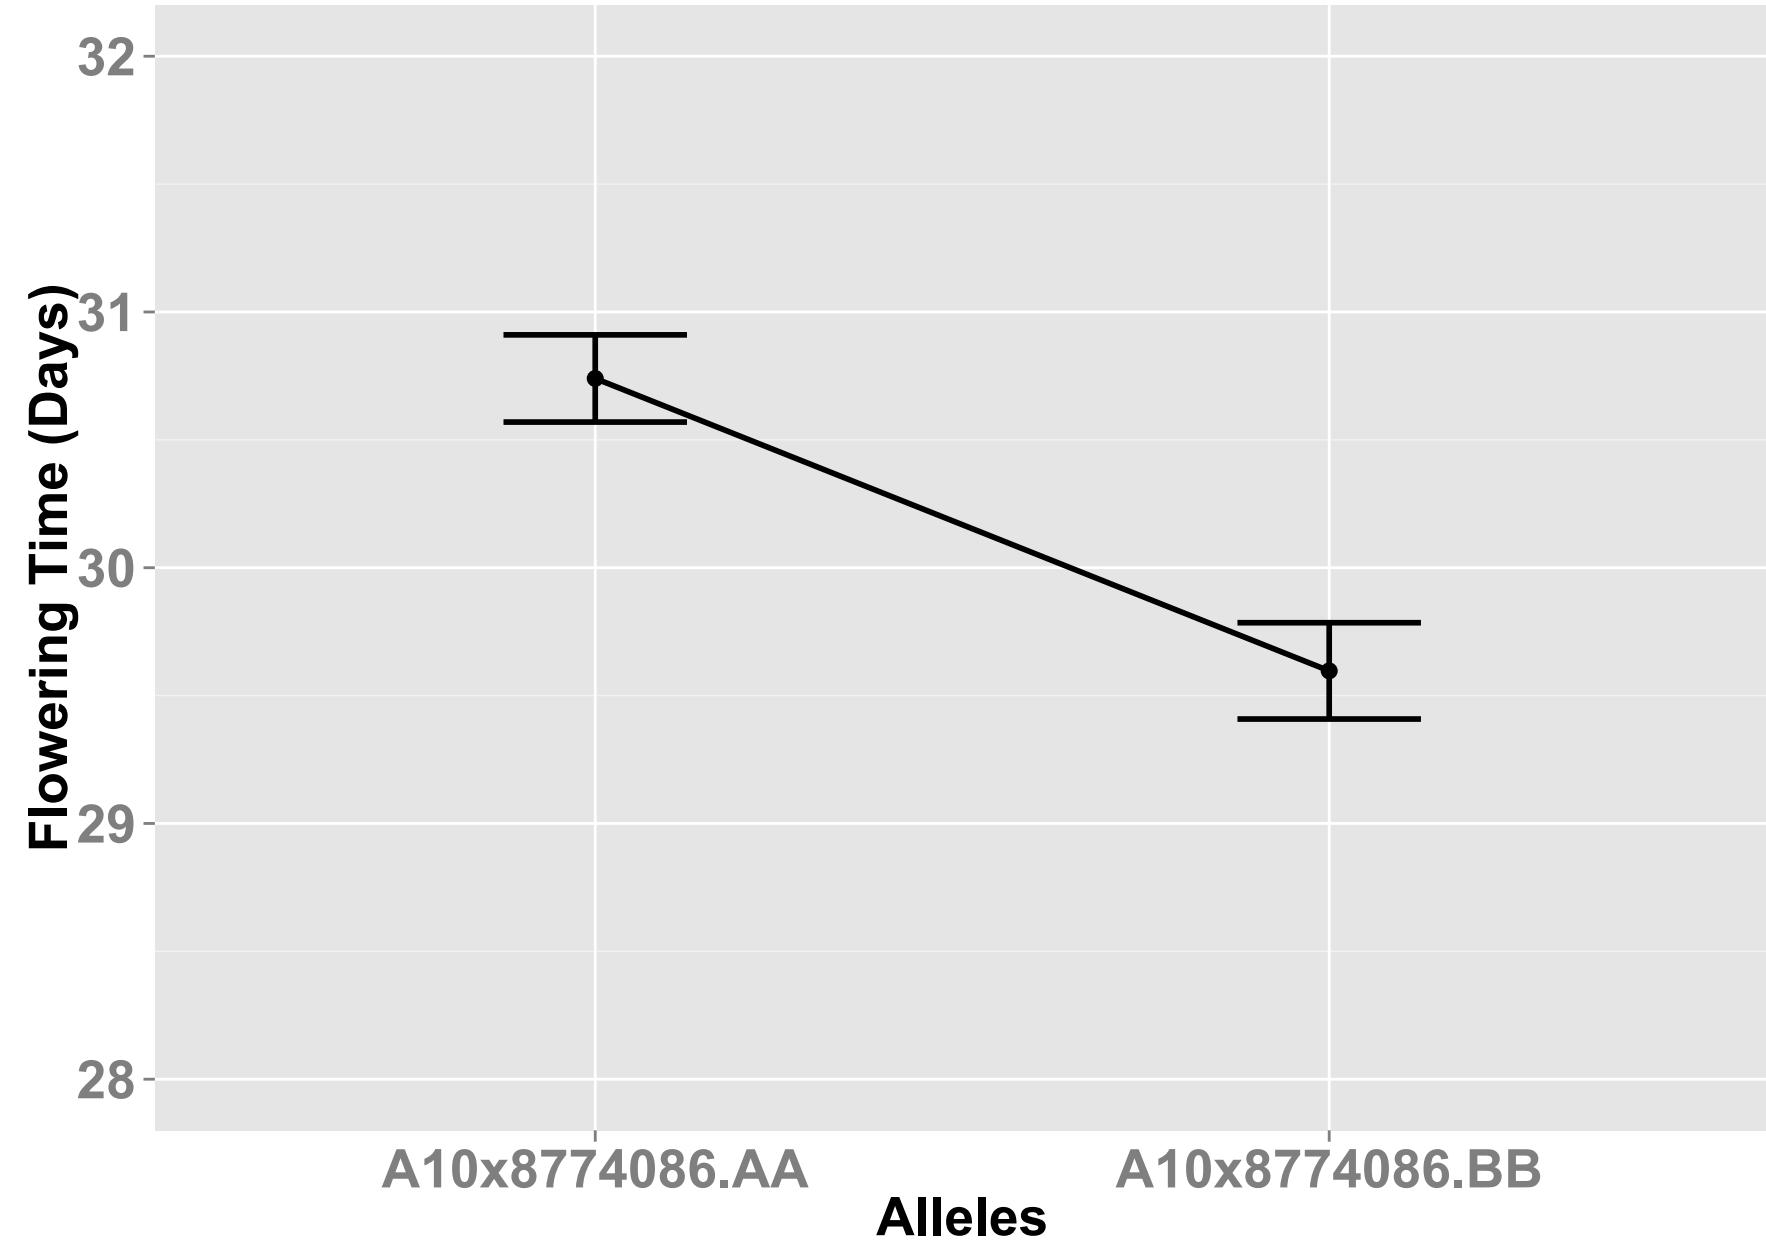

$\text{phenotype} = m * \text{gtBB} + \text{mean} + \text{error}$

Given genotype, is slope different from 0?

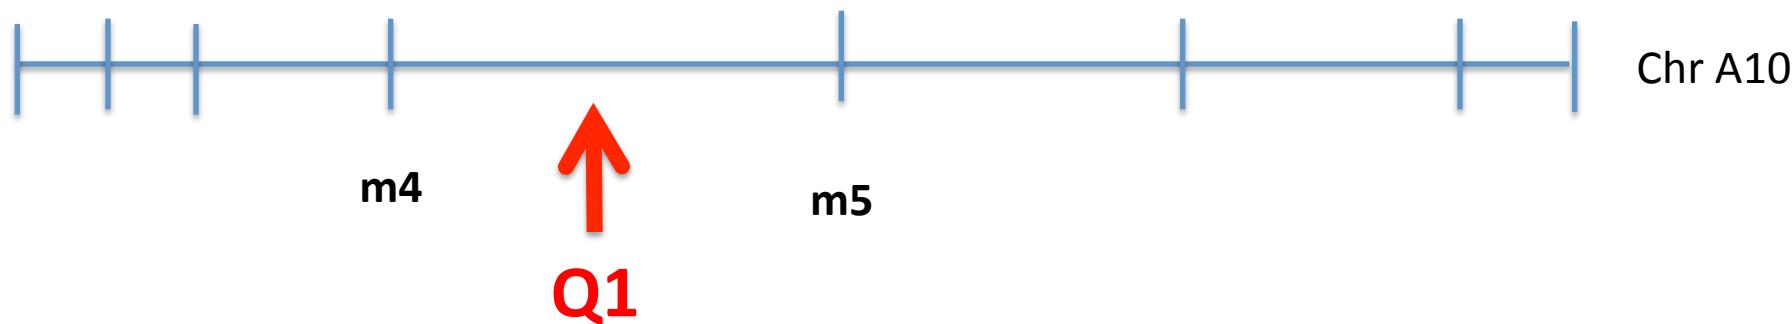

# Brassica rapa phenotypic distributions

# What if QTL is located between known markers?

## Solution: Interval Mapping

Evaluate intervals between markers rather than just markers themselves

Use known genotypes at flanking markers to determine allelic effect size of QTL

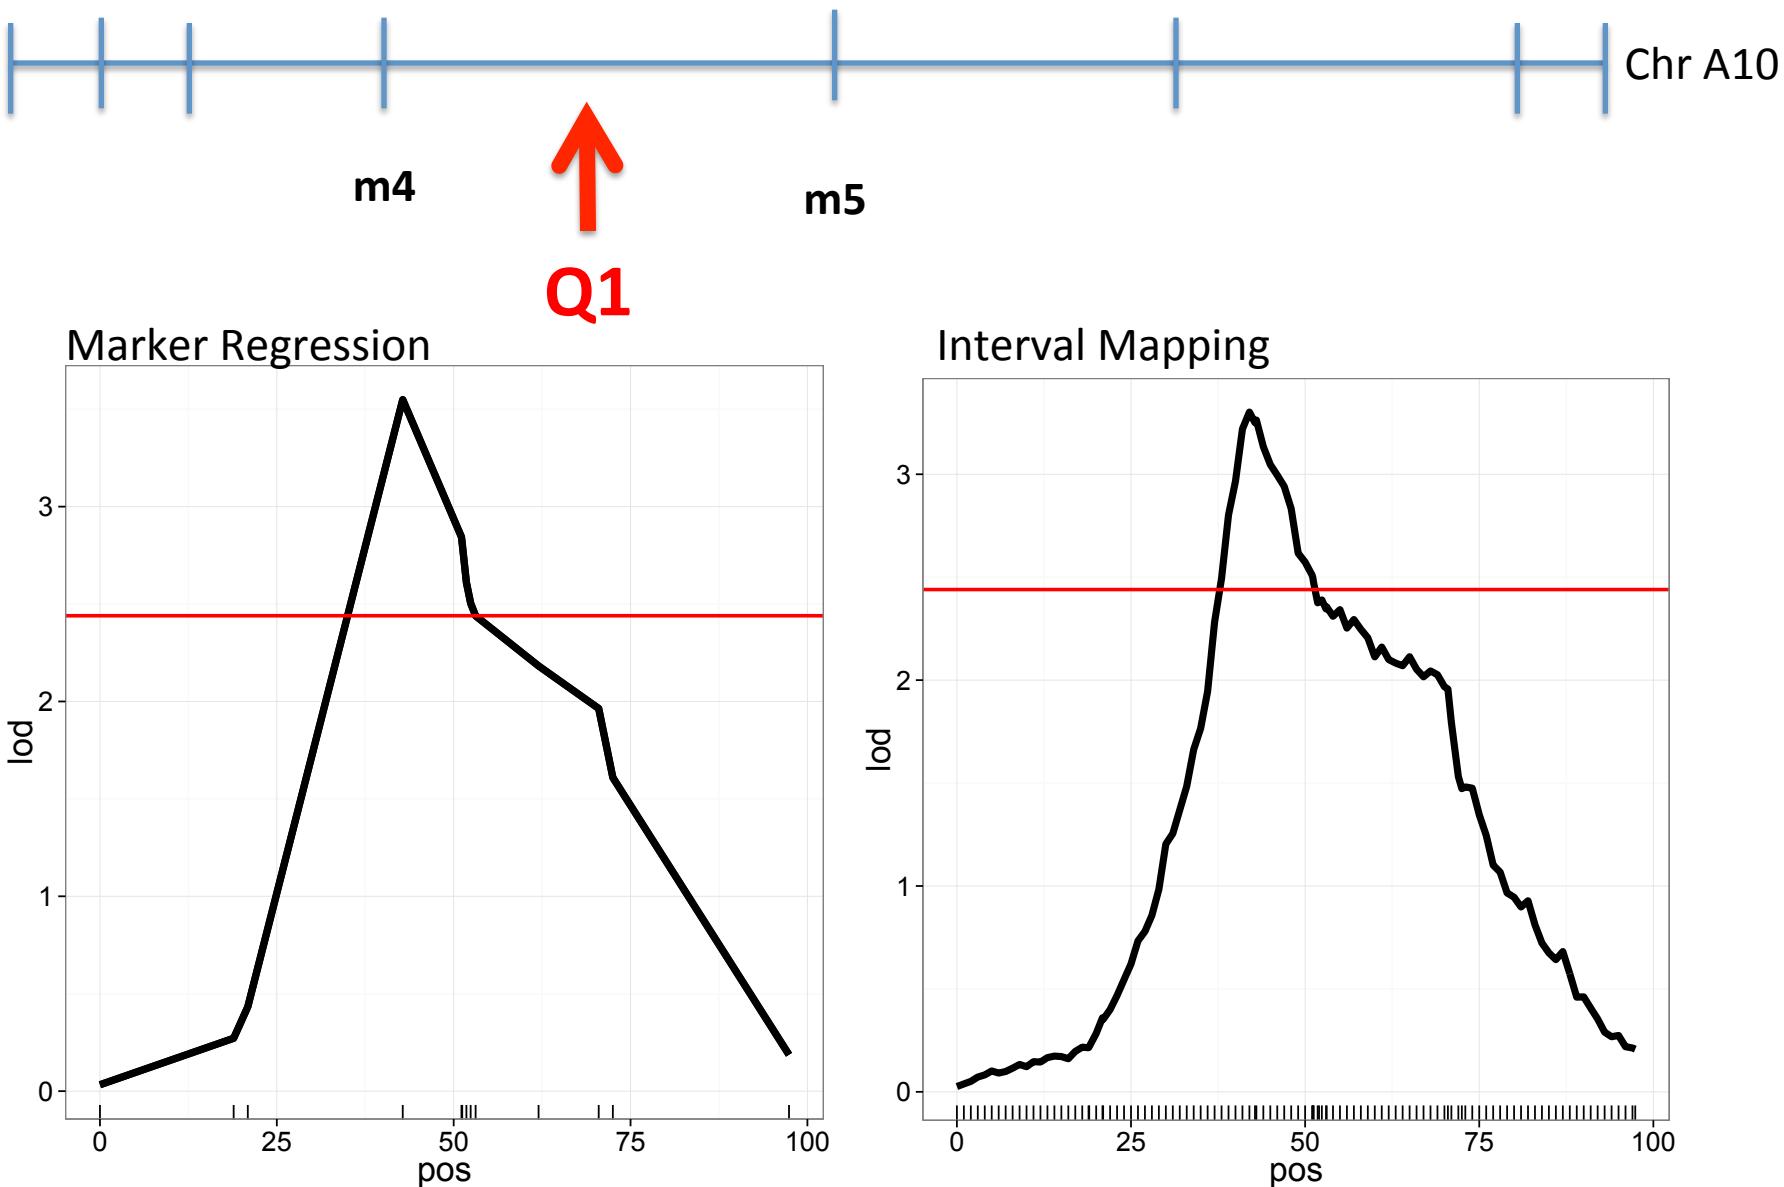

Use recombinants to estimate whether QTL is located closer to marker 4 or marker 5

LOD score: Likelihood of linkage.

$\text{LOG10}(\text{likelihood of linkage}/\text{likelihood unlinked})$

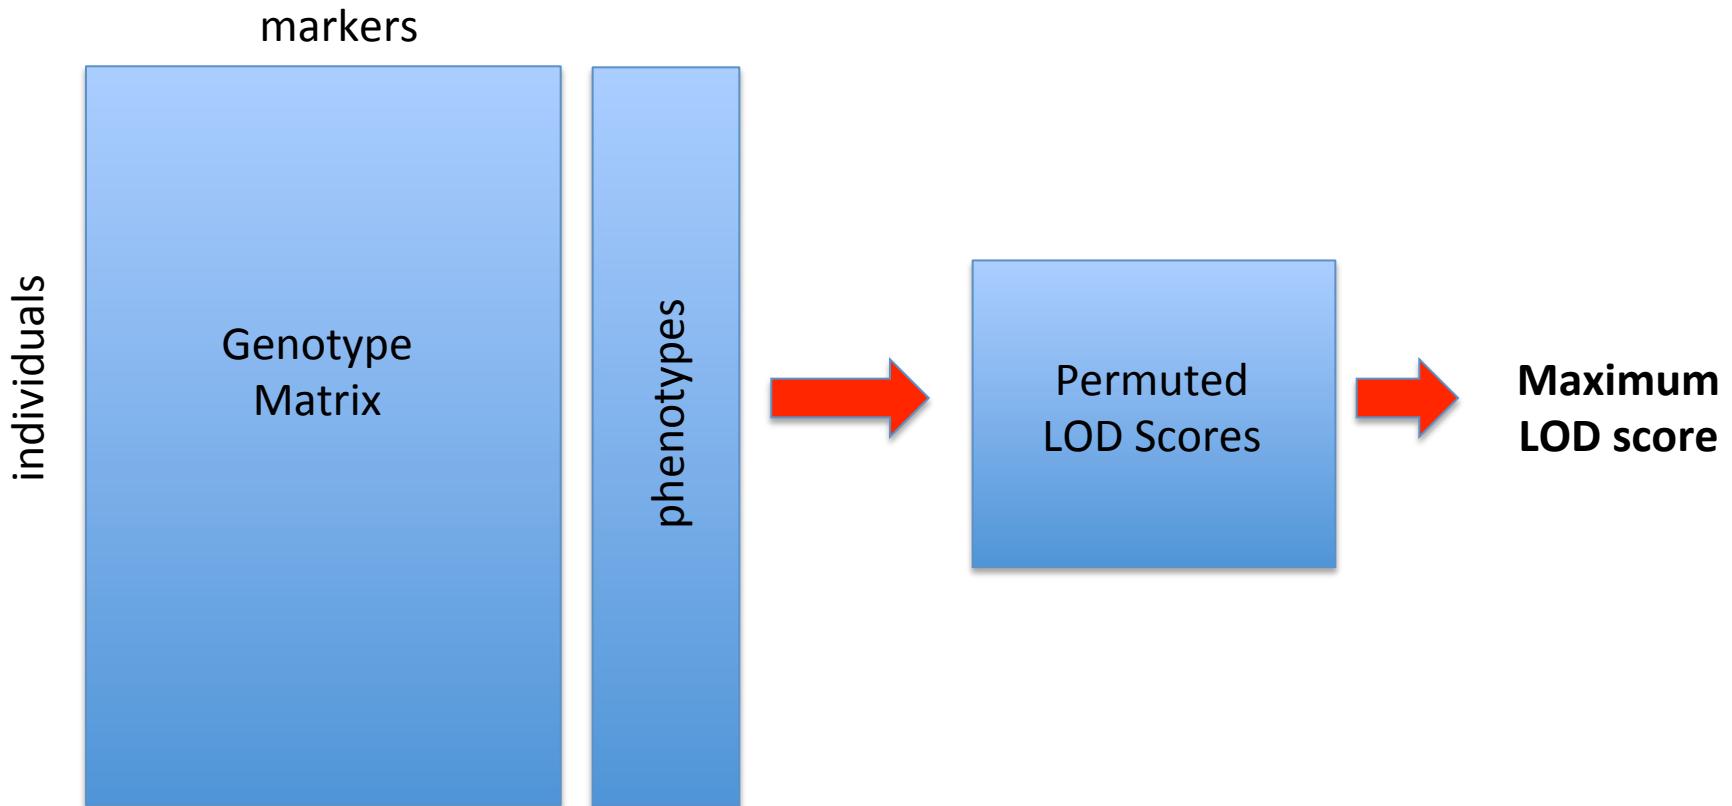

Compare to null model that there is no QTL anywhere in genome

# Flowering Time QTL Chromosome A10

Dense Grid Search for QTL after calculating genotype probabilities  
Becomes extremely important for multiple QTL models

# Significance Threshold by permutation tests

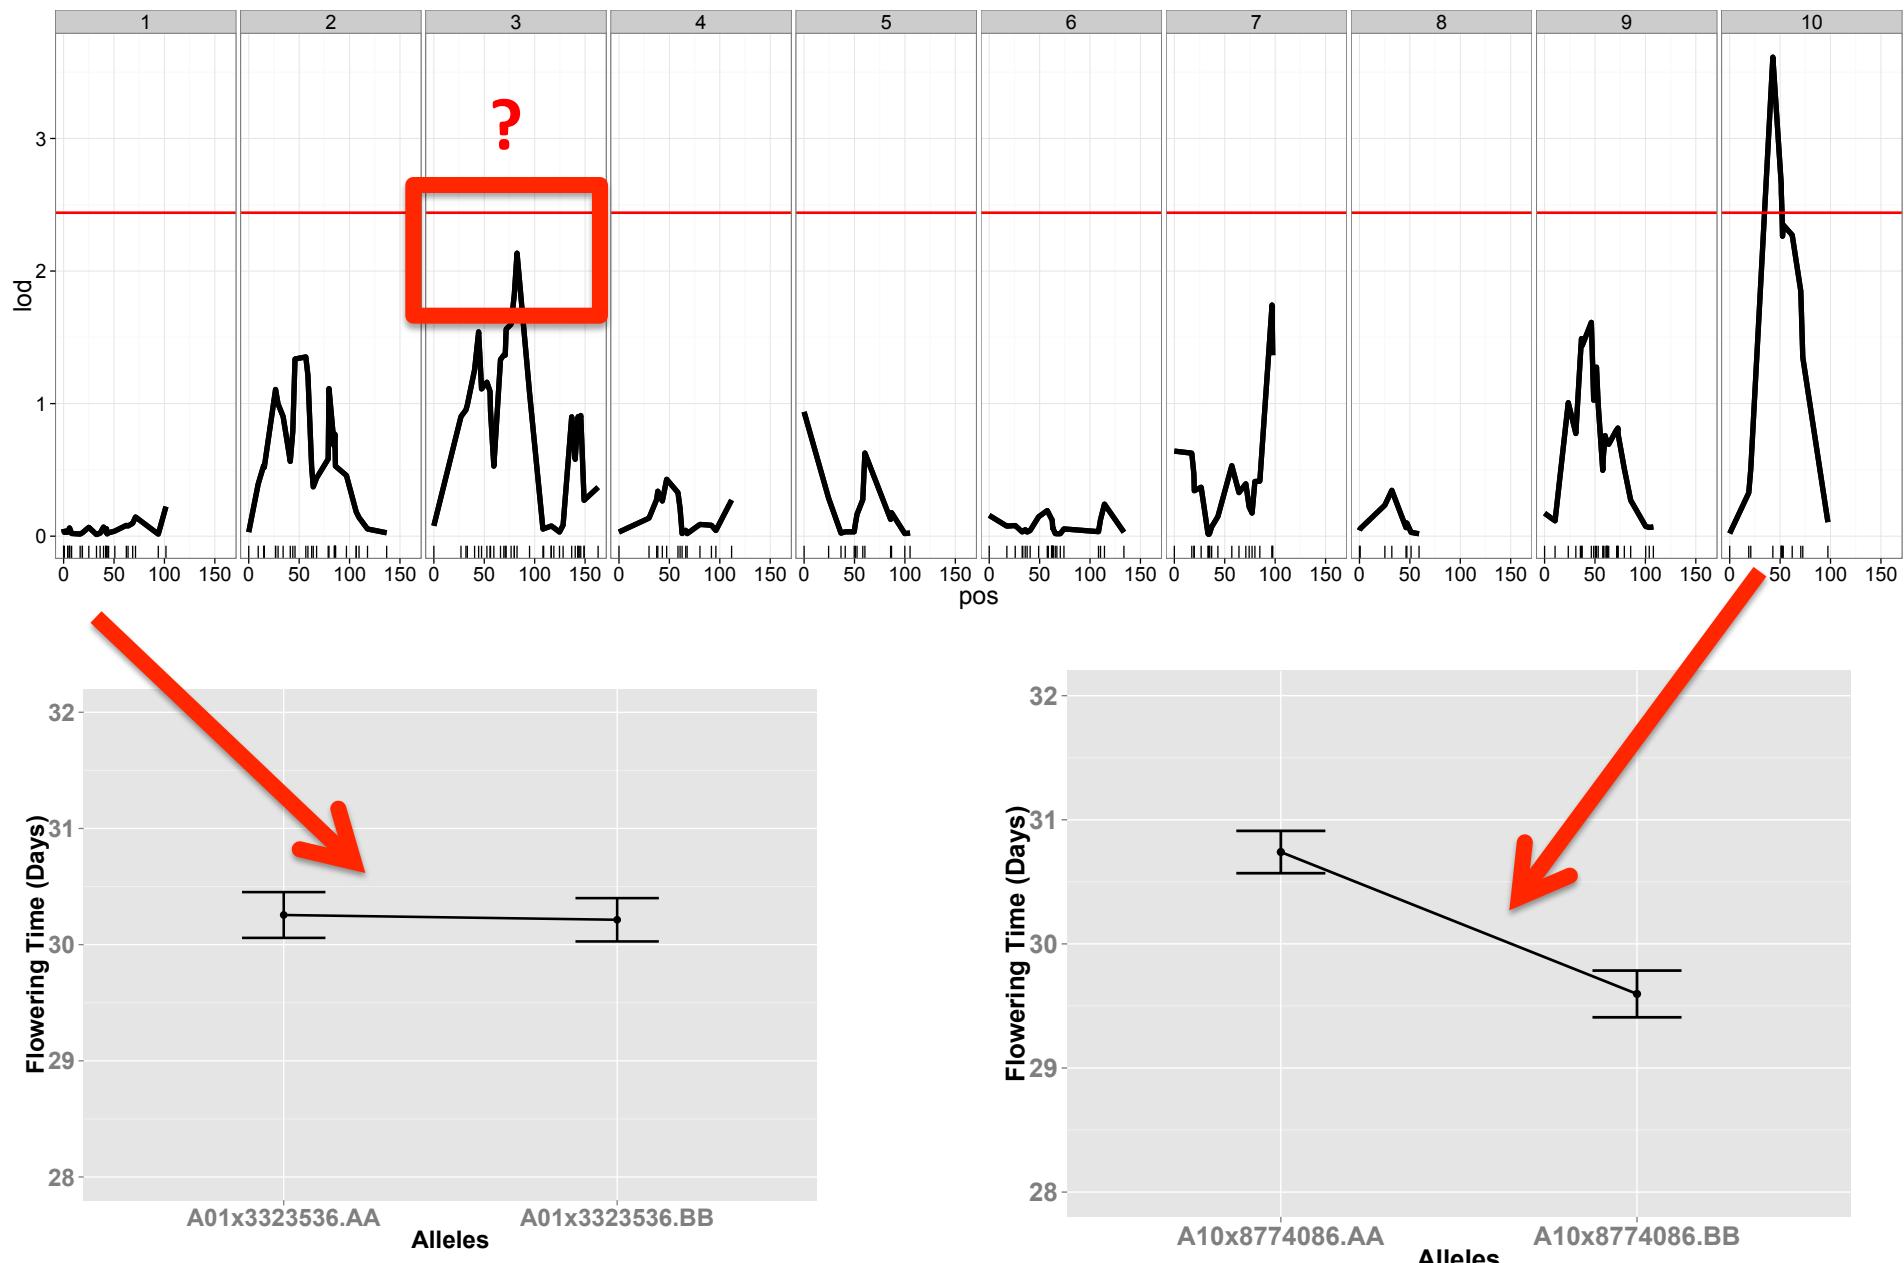

**Randomly assign phenotypes to genotypes**

**Calculate genome wide LOD scores**

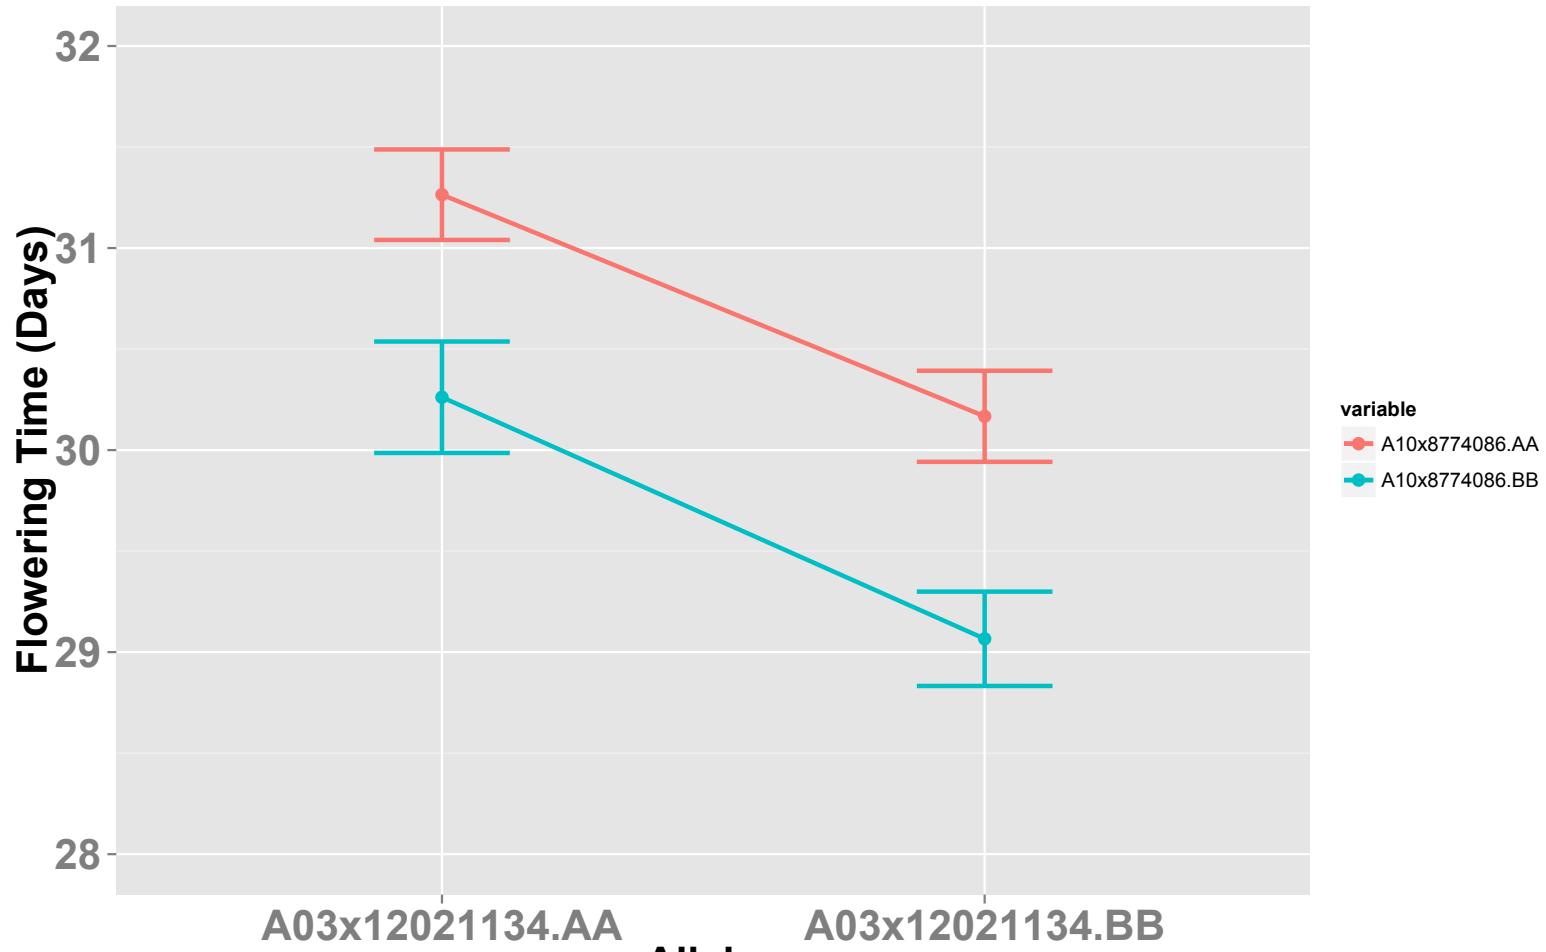

**Take maximum LOD score**

**Repeat 1000x**

**What about multiple QTL explaining trait?**

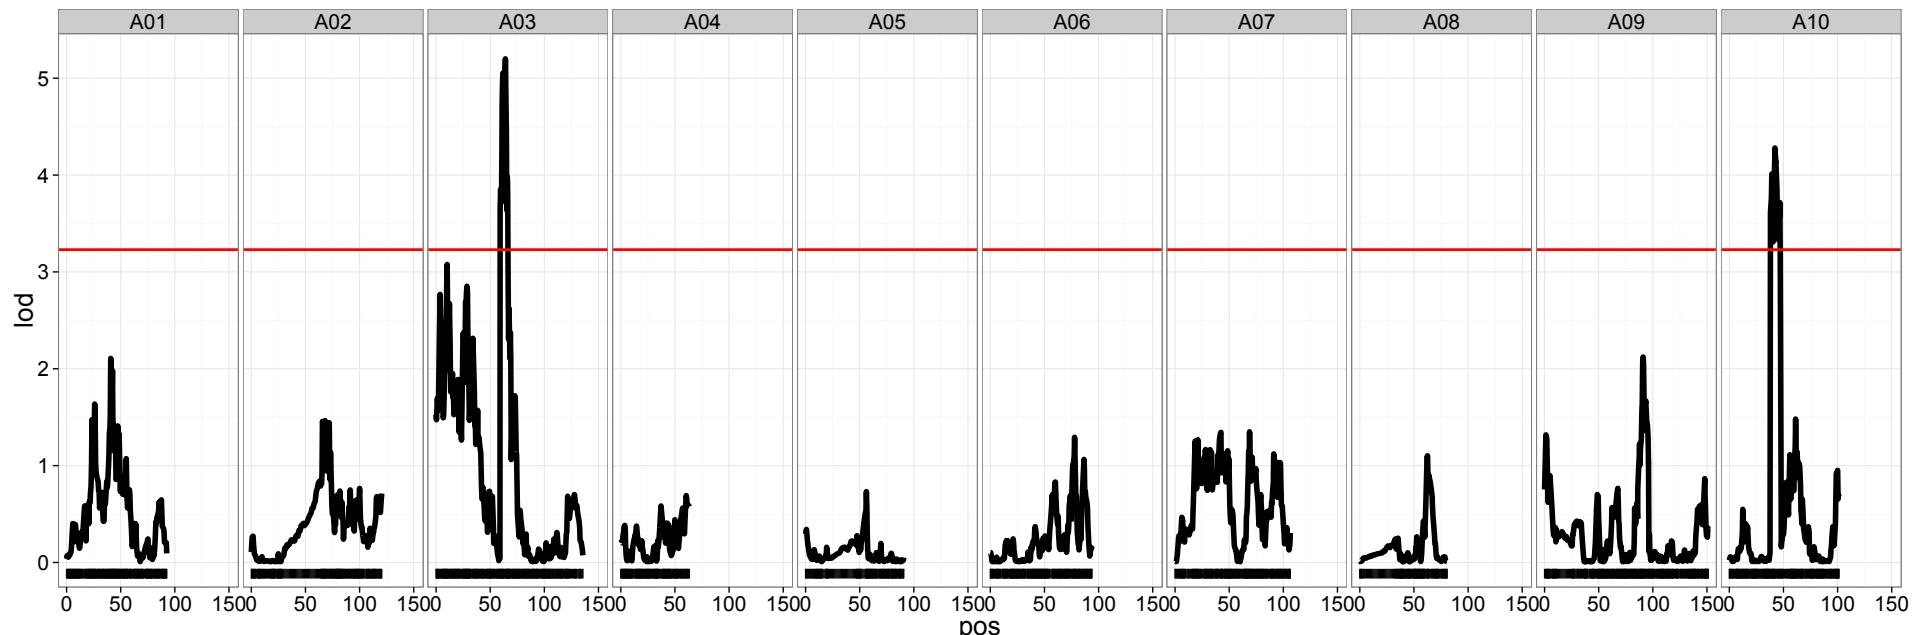

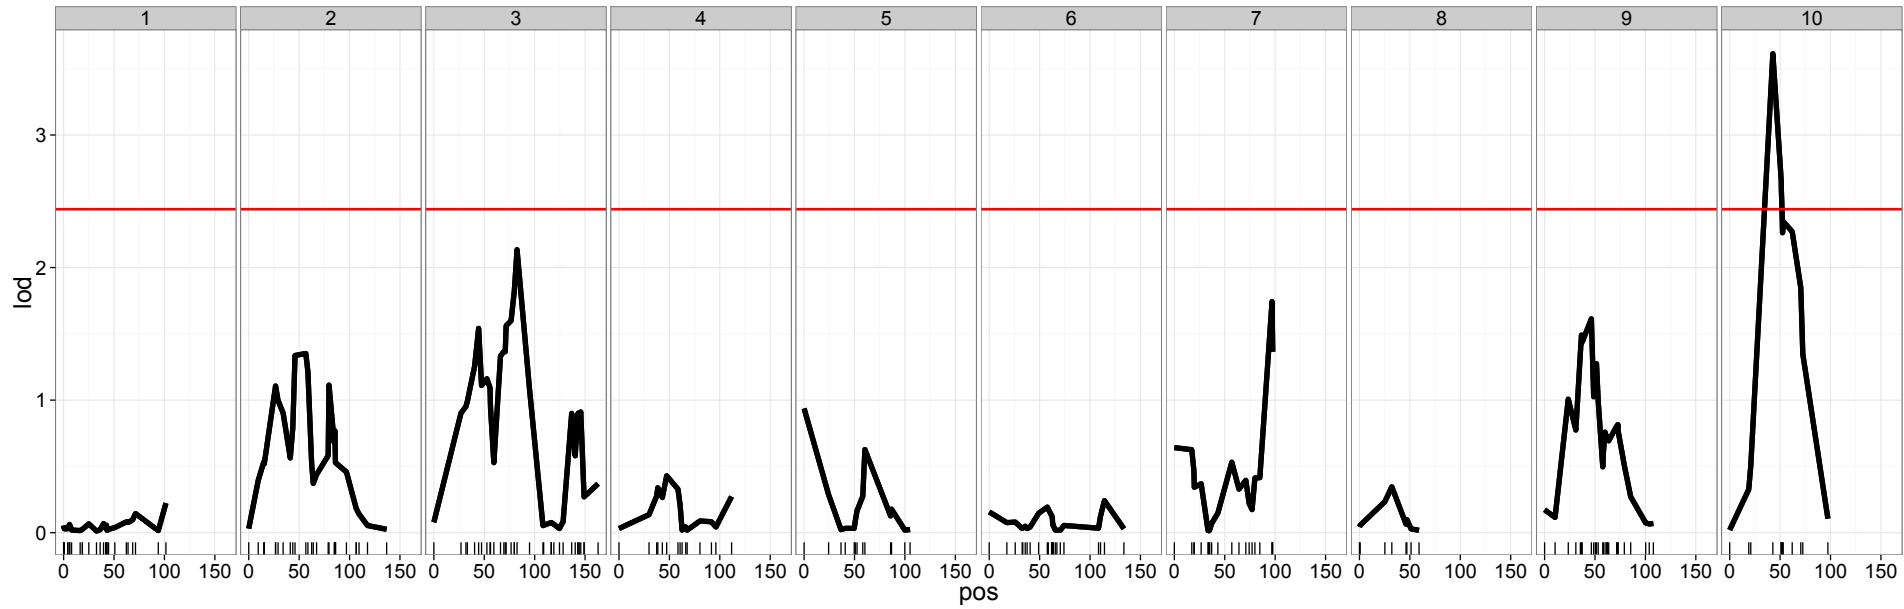

# Multi-QTL Models: model selection problem

**Simplified, ignoring interval mapping:**

phenotype = mean + m1\*gtA03\_BB + m2\*gtA10\_BB + error

What if QTL interact? What would this plot look like?

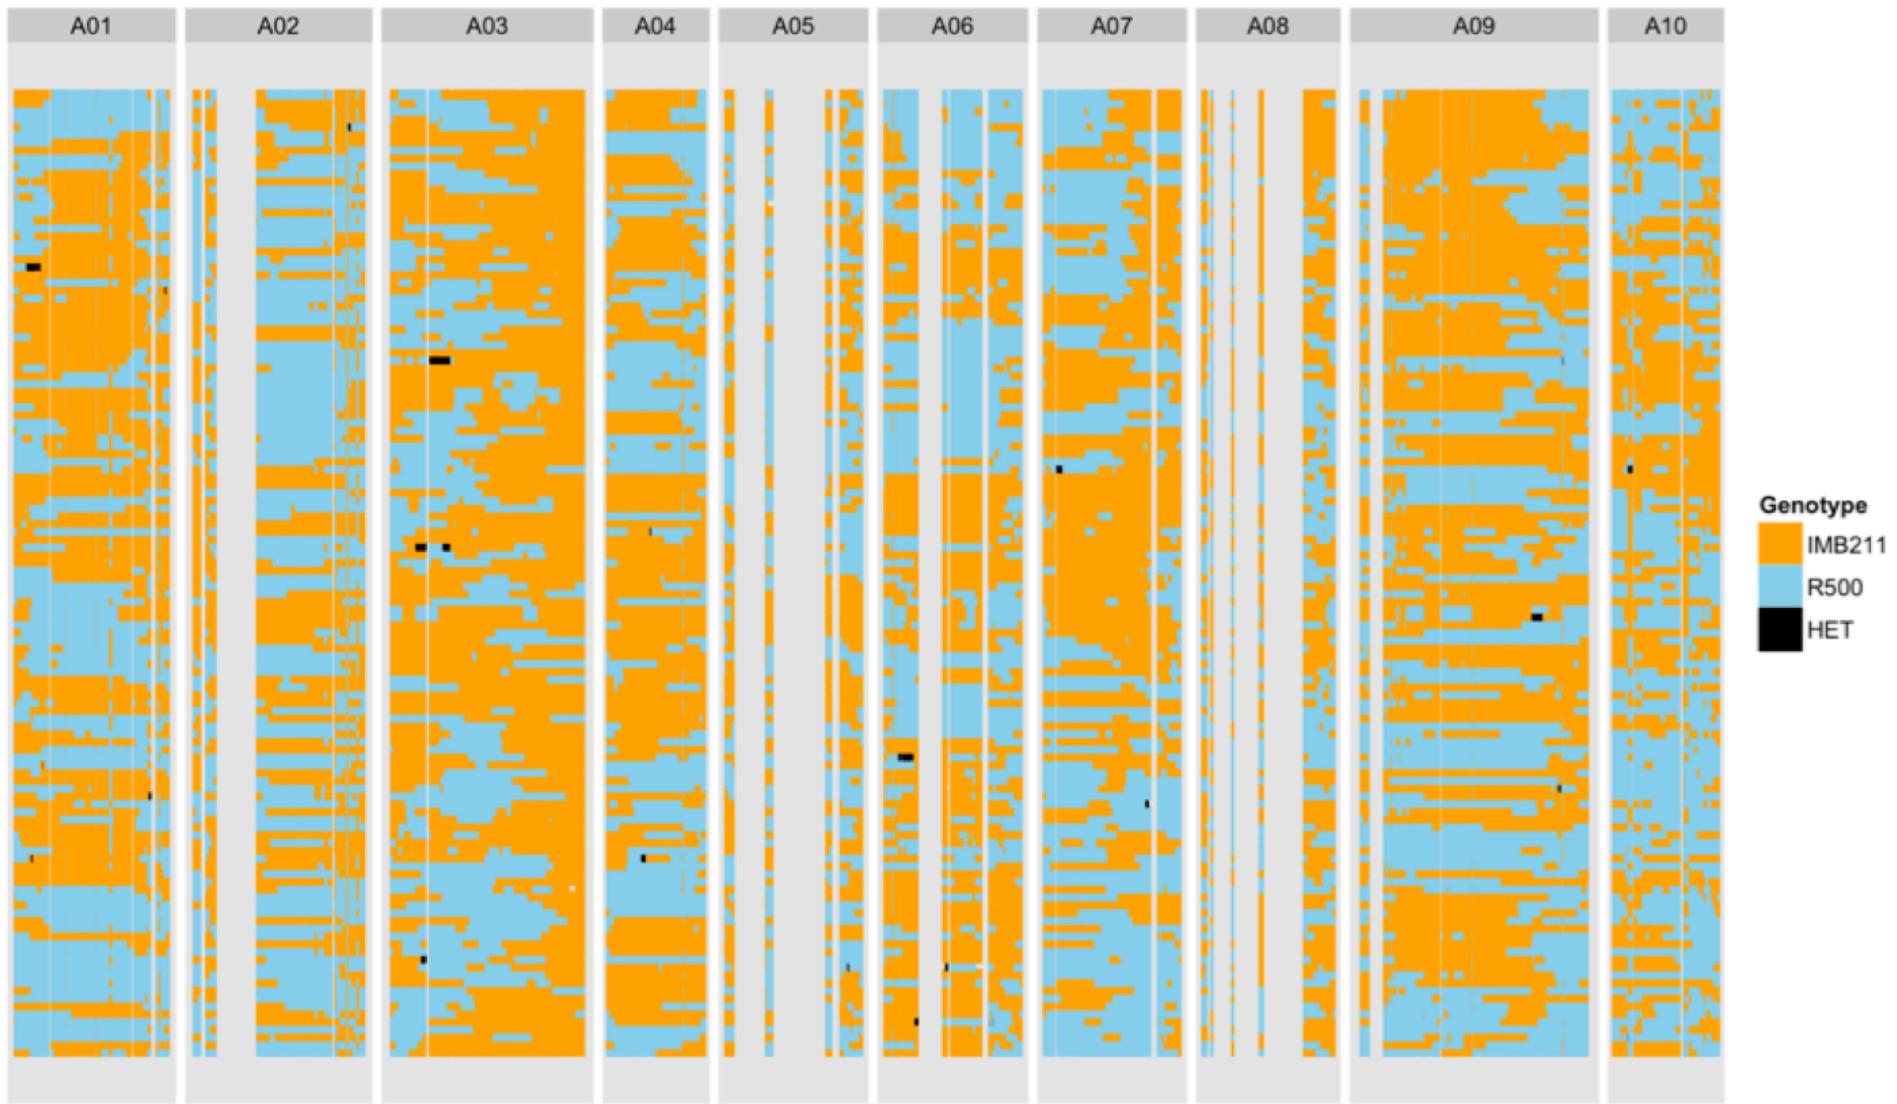

**Multiple QTL Models significantly improve fit and narrow QTL peaks**

# Lecture Outline

- What is a QTL?
- Successful QTL mapping examples
- Single Marker Regression
- Simple Interval Mapping
- Multi-QTL models
- Genome Wide Data- How do we scale?
- Expression QTL (eQTL)
- Integrating eQTL with other QTL for candidate gene identification

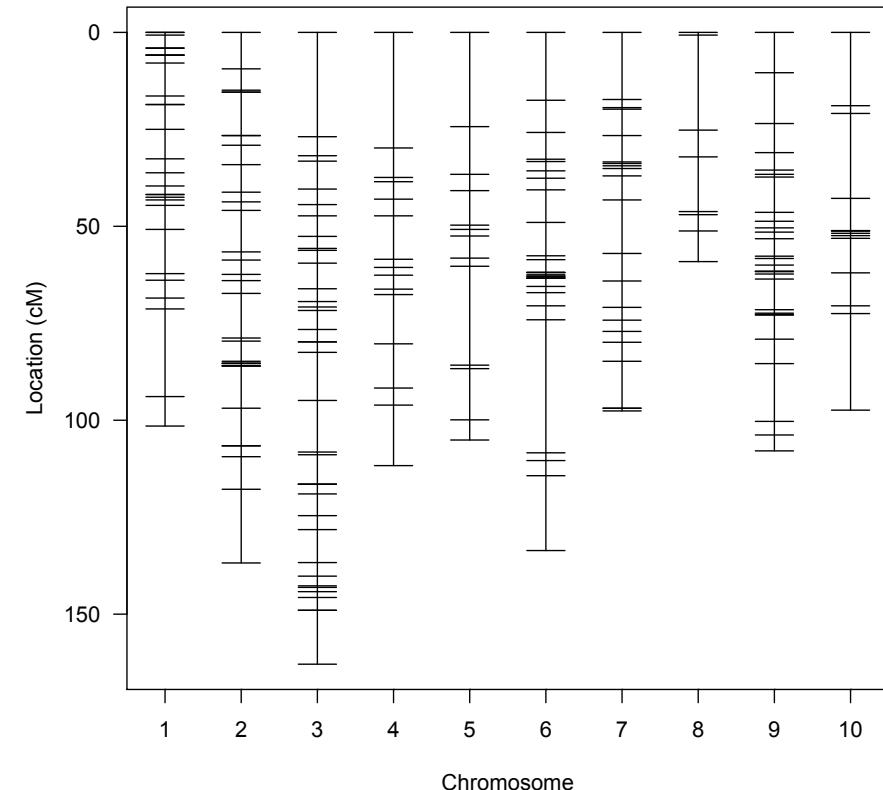

# Genome Scale Sequencing Data

True mosaic of the parental genotypes

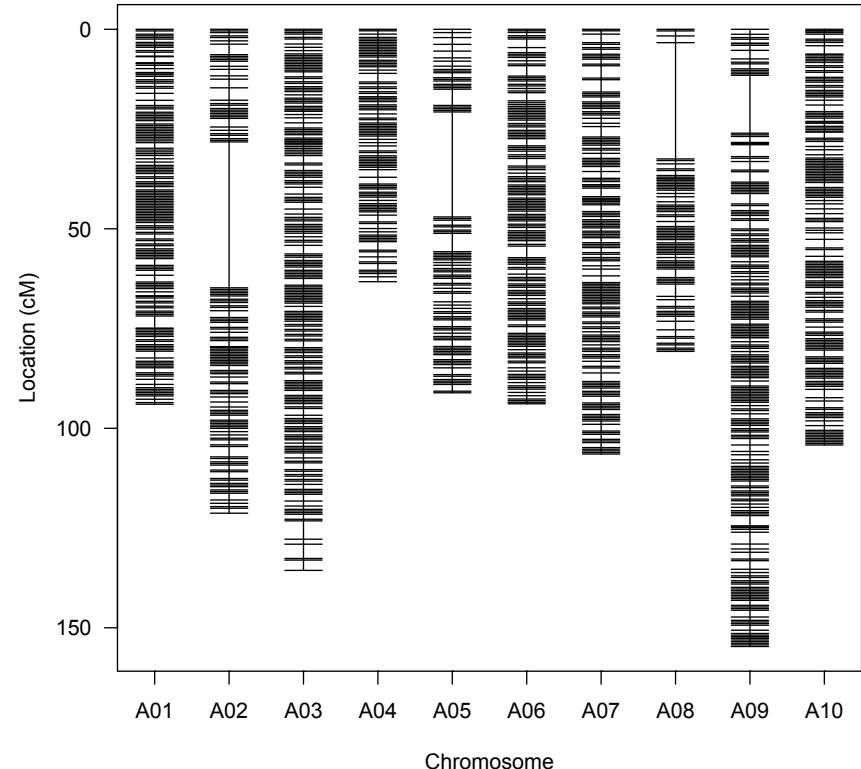

# Improved Genetic Map

Genetic map

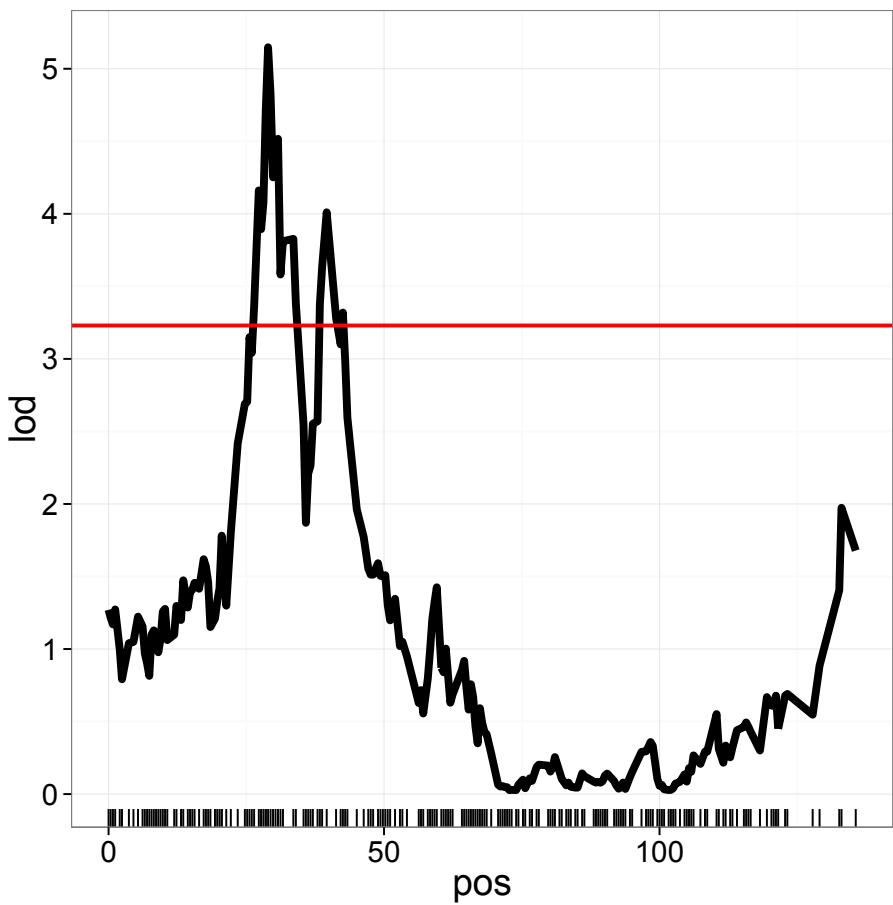

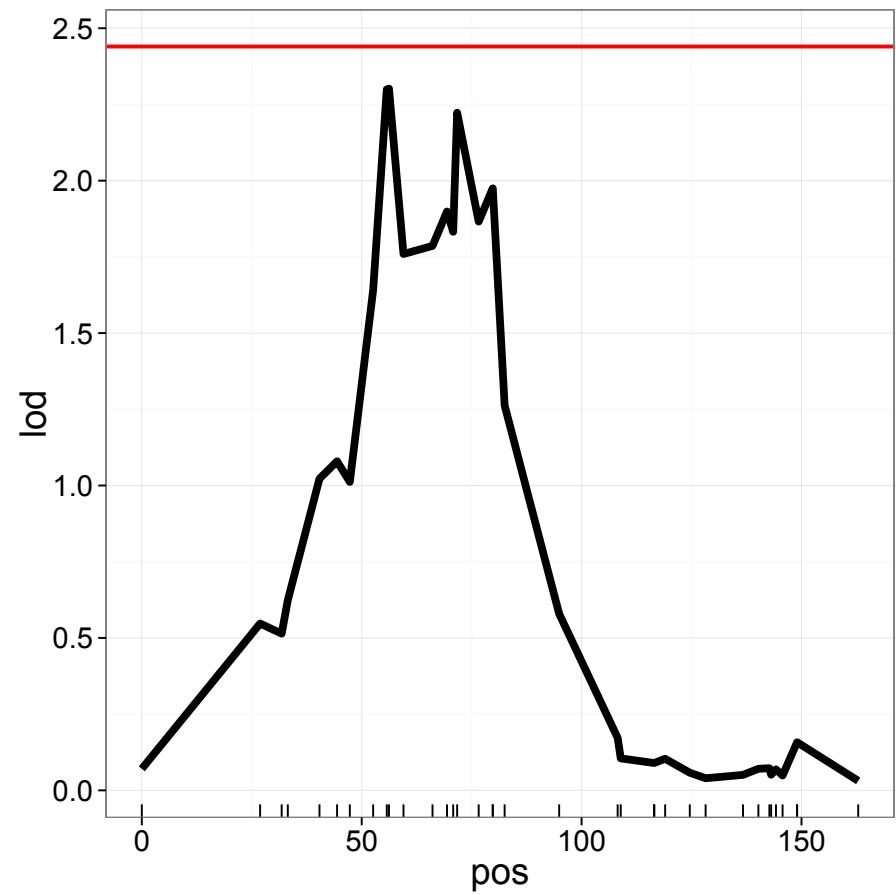

**225 Markers**  
Difficult to anchor to genomic  
location

Genetic map

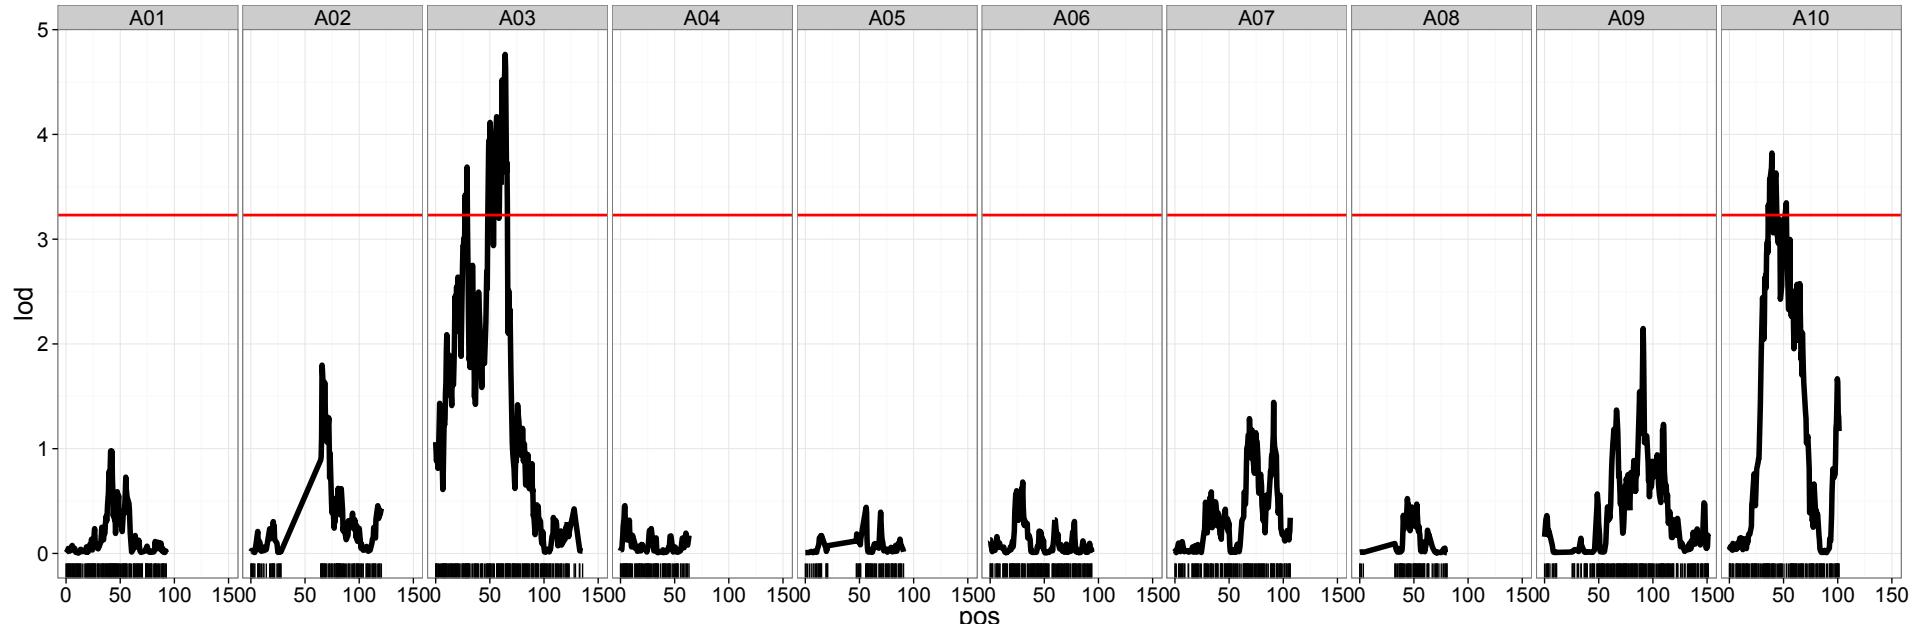

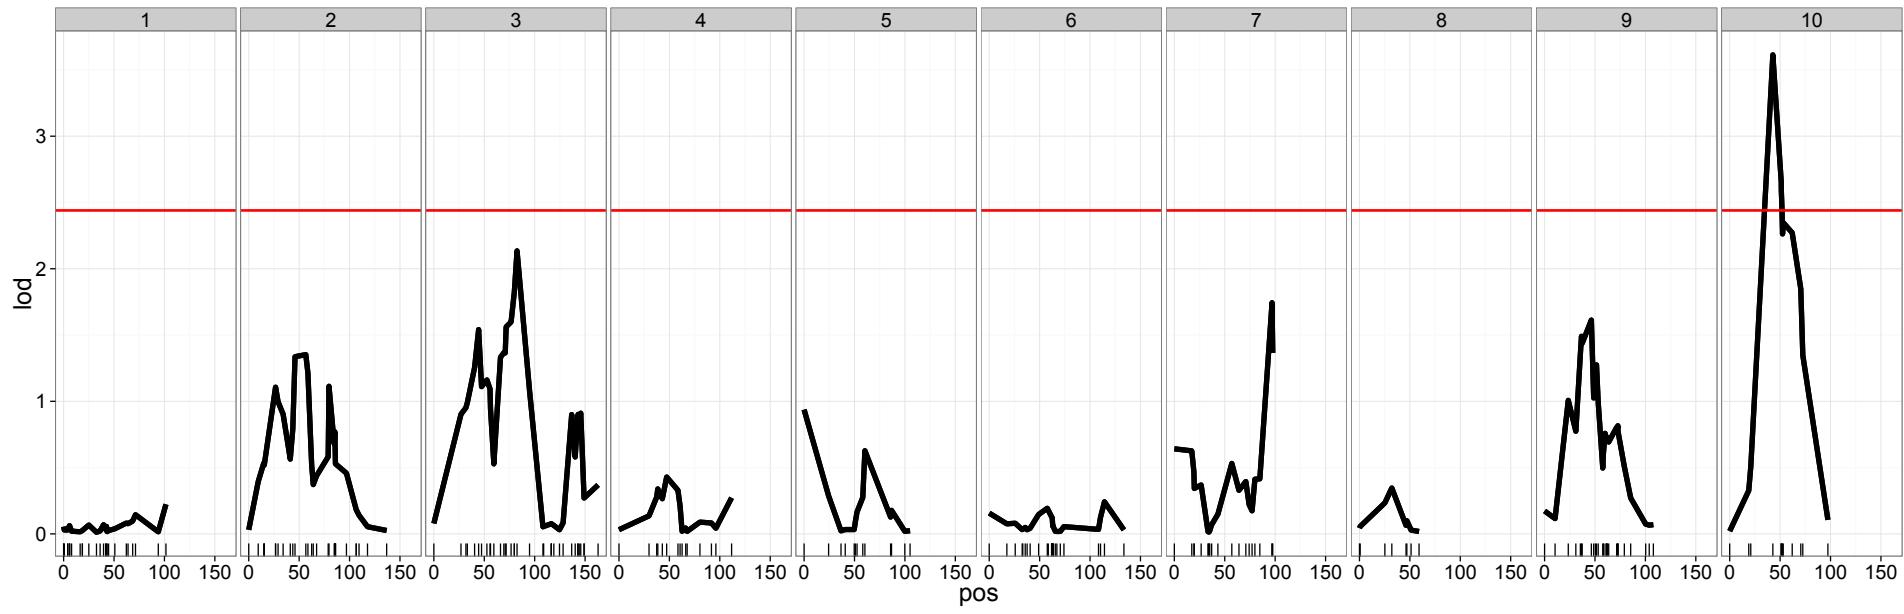

**1400+ markers with  
known genomic  
coordinates**

# Plant Height

New map improves mapping resolution for known QTL

Remap all known traits in the population using new genetic map

# Lecture Outline

- What is a QTL?
- Successful QTL mapping examples
- Single Marker Regression
- Simple Interval Mapping
- Multi-QTL models
- Genome Wide Data- How do we scale?
- Expression QTL (eQTL)
- Integrating eQTL with other QTL for candidate gene identification

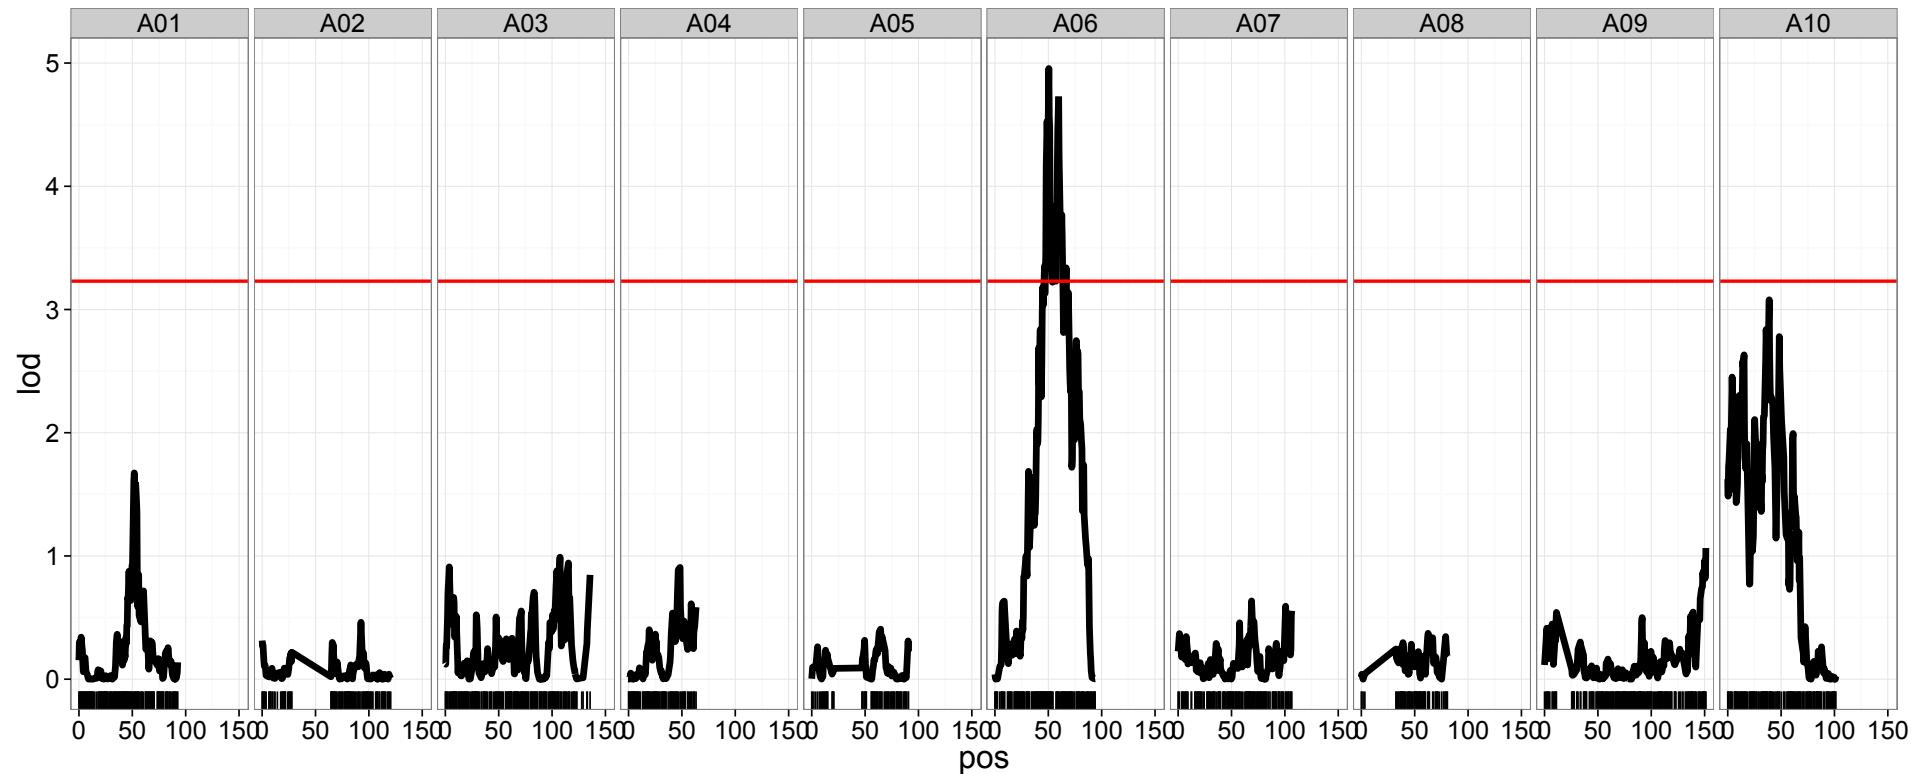

# Gene Expression QTL (eQTL)

Polymorphism → Differential Gene Expression

- Can we find causative genes underlying physiological QTL by identifying *cis*-eQTL?

# Cis and Trans eQTL example

Gene is located on chromosome A10, but peak for its expression also on A06
